ARUL ANANDAR COLLEGE (AUTONOMOUS), KARUMATHUR
DEPARTMENT OF PHYSICS

PROGRAMME SPECIFIC OUTCOME (PSO)

PSO1: Understand the basic concepts of physics for the applications in various scientific and industrial arena.

PSO2: Acquire the problem-solving skills and experimental skills keeping in mind the needs of the society and environment.

PSO3: Formulate, conduct, analyze, interpret the theory and experiments in Physics effectively as an individual or a leader of a group.

PSO4: Utilize the experimental tools and numerical techniques with an understanding of physics concepts.

PSO5: Demonstrate and communicate the theoretical and experimental Physics ideas towards higher education.

Arul Anandar College (Autonomous), Karumathur

Department of Physics

Class	**: B.Sc. Physics**	**Part**	**: III Core-1**
Semester	**: I**	**Hours**	**: 90**
Subject Code	**: 22UPYC11**	**Credit**	**: 5**

MECHANICS & PROPERTIES OF MATTER

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives:

- To understand the impact of elastic bodies and the principle involved in the projectile motion.
- To analyze the concept of centre of gravity and grasp the properties of oscillations and waves.
- To enrich the knowledge of mechanical properties of solids and fluids.

Unit 1 Impact of Elastic Bodies and Projectile motion (18 hrs)

Impact of Elastic Bodies: Impulse of a force – collision – Fundamental Principles of Impact – Oblique impact of a smooth sphere on a fixed smooth plane - Direct Impact of Two Smooth Spheres – Loss of K.E. due to a direct impact of two smooth spheres - Oblique impact of a two smooth spheres - Loss of K.E. due to Oblique impact. **Projectile motion:** Range on an inclined plane – Maximum Range – Two directions of Projections– Two-body problem and the reduced mass.

Unit 2 Centre of Gravity (18 hrs)

Introduction – Distinction between C.G and C.M – centre of Gravity of a solid cone - centre of Gravity of a hollow right circular cone (without base) - centre of Gravity of a solid hemisphere - centre of Gravity of a hollow hemisphere - centre of Gravity of a solid tetrahedron - centre of Gravity of a compound body – centre of Gravity of remainder – Stable, unstable and Neutral Equilibrium.

Unit 3 Oscillations and Waves (18 hrs)

Oscillations: Simple Harmonic Motion (SHM), Composition of two SHM in straight line and perpendicular to each other. Lissajous figures. Free vibrations, Damped vibrations, Forced vibrations, Resonance- Sharpness of resonance. **Waves:** Wave motion, types, Differential equation of wave motion, Principle of superposition, Stationary waves, Beats, Doppler effect: expression for apparent frequency- relative motion between source and observer, applications.

Unit 4 Elasticity (18 hrs)

Elastic Moduli– Definitions – Poisson's Ratio – Relation between Elastic Constants – Limiting Values of Poisson's Ratio – Torsion – Torsion of a cylinder - Torsional Pendulum – Theory and Experiment – Work done by twist – Bending of Beams – Bending Moment – Cantilever Depression – Theory and Experiment – Uniform and Non – Uniform Bending – Theory and Experiment.

Unit 5 Viscosity and Surface Tension (18 hrs)

Viscosity: Equation of continuity– Bernoulli's theorem (Explanation, Proof). Streamed line motion – turbulent motion – coefficient of viscosity and its dimension – Poiseuille's formula for the Rate of flow of liquid in a capillary tube – Stokes' Formula – Terminal velocity – Stokes' method for the coefficient of viscosity of a viscous liquid. **Surface tension**: Definition and dimension of surface tension – Work done in increasing the area of a surface – Pressure difference across a liquid surface - Excess of pressure over curved surfaces.

Books for Study:

1. Murugesan, R., Mechanics & Mathematical Physics, S Chand & Co, New Delhi, 2016.
   Unit 1: 1.1 -1.6, 2.1- 2.4.
   Unit 2: 3.1- 3.9.
   Unit 5: 5.1, 5.4.
2. Subrahmanyam and Brijlal., Waves and Oscillations, S Chand & Co, New Delhi, 2ed
   Unit 3: 2.1,2.2,2.4,2.9; 4.1- 4.6, 4.12; 6.1,6.2,6.4,6,12,6.13; 9.1- 9.4
3. Murugesan, R., Properties of Matter, S Chand & Sons, New Delhi, 2020.
   Unit 3: 11.1 -11.4
   Unit 4: 1.2, 1.7, 1.9, 1.13, 1.14, 1.15, 1.16, 1.21
   Unit 5: 2.1, 2.2, 2.3, 2.8, 2.9, 3.1, 3.3, 3.8, 3.9.

Books for Reference:

1. Murugeshan, R. Mechanics & Mathematical Methods, S Chand & Co, New Delhi, 2014
2. Narayanamurthy, M. & Nagarathnam, Dynamics - National Publishing, New Delhi, 1991.
3. Mathur, D.S., Mechanics, Sultan Chand, New Delhi, 2020.
4. Halliday and Resnik., Principles of Physics, Wiley India PVT, New Delhi, 2011.
5. P. Duraipandian, Laxmi Duraipandian and Muthamizh Jayapragasam, Mechanics Sixth S. Chand & company Ltd, New Delhi, 2005.
6. D.S.Mathur, Elements of Properties of Matter - S.Chand& Co., New Delhi, 2007.
7. Brijlal and Subramanyam, Properties of Matter- S. Chand Publishers, New Delhi, 2006.
8. R.N.Chaudhuri., Waves and Oscillations, New Age International Publishers, New Delhi,2010.
9. Richard P. Feynman, Robert B. Leighton & Mathew Sands, Feynman Lectures on Physics, Narosa Publishers, New Delhi, 2008.

Course outcomes

On completion of the course, the students will be able to

CO 1: Understand the properties of elastic bodies with experiments and the principle involved in the projectile motion.

CO 2: Explain the concept of Centre of gravity along with its effect on the stability of objects.

CO 3: Analyze the various principles and properties of Oscillations and Waves.

CO 4: Evaluate the elastic parameters of materials.

CO 5: Discuss the phenomena of viscosity and surface tension.

Mapping of Cos with PSOs & POs:

ALLIED PHYSICS – 1

(For Maths students)

MECHANICS, PROPERTIES OF MATTER, THERMAL PHYSICS and OPTICS

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives:

- To provide knowledge in the field of mechanics, properties of matter, thermal physics and optics for maths students

Unit 1: Waves and Oscillations (9 Hrs.)

Simple harmonic motion - laws of transverse vibrations of strings - Melde's string - transverse and longitudinal modes - ultrasonic's - production - application and uses - reverberation - factors for good acoustics of hall and auditorium.

Unit 2: Properties of Matter (9 Hrs.)

Elasticity - different moduli of elasticity - poisson's ratio - energy stored in a stretched wire - bending of beam -Young's modulus by uniform and non - uniform bending - torsion pendulum - determination of rigidity modulus by torsional pendulum. Viscosity: Streamline flow and turbulent flow - Coefficient of viscosity.

Unit 3: Thermal Physics (9 Hrs.)

Postulates of the kinetic theory of gases – Van der waals equation of states -Joule - Kelvin effect - porous plug experiment. Laws of thermodynamics - heat engine - entropy - change of entropy in reversible and irreversible processes.

Unit 4: Geometrical Optics (9 Hrs.)

Refraction- Refraction through a thin prism – dispersion through a prism- expression for the dispersive power of material of a thin prism - combination of two prisms to produce dispersion without deviation - direct vision spectroscope - defects of images-coma- - spherical aberration in lens – methods of minimizing spherical aberration - chromatic aberration in lens - removal of chromatic aberration.

Unit 5: Physical Optics (9 hrs)

Interference – Interference in thin films - air wedge - determination of diameter of a thin wire by air wedge - Diffraction - theory of transmission grating- Normal incidence - polarization- double refraction- Nicol prism.

Books for Study:

1. R. Murugesan (2016) Allied Physics, First Edition, S.Chand and Co., New Delhi-110005.

Unit 1 : 1.1, 1.7, 1.9, 1.11, 1.12, 1.13, 1.14, 1.15, 1.16, 1.17, 1.18, 1.19

Unit 2 : 2.1, 2.2, 2.3, 2.4, 2.5, 2.6, 2.7, 2.9, 2.12, 2.13, 2.14, 2.15

Unit 3 : 3.1, 3.2, 3.4, 3.5, 3.15, 3.16, 3.17, 3.18, 3.19, 3.20, 3.21, 3.22

Unit 4 : 5.1, 5.6, 5.10, 5.11, 5.12, 5.13, 5.14, 5.16, 5.18, 5.19, 5.22, 5.25

Unit 5 : 6.2, 6.3, 6.5, 6.8, 6.10, 6.11, 6.12, 6.13, 6.14, 6.16, 6.17

Books for Reference:

1. Brijlal and Subramanyan (2002), Properties of Matter, S Chand Publication, New Delhi.
2. NN Bhargava, DC Kulshreshtra, SC Gupta, (1984). Sixteenth Edition, Basic Electronics and Linear Circuits, Tata McGraw-Hill Publishing Co., New Delhi.

Course outcomes

On completion of the course, the students will be able to

CO 1: Describe the wave nature

CO 2: Explain the properties of elastic bodies with experiments.

CO 3: Characterize the basic concepts of thermodynamics.

CO 4: Interpret the change of entropy.

CO 5: Understand the dispersion of light through various medium.

CO 6: Analyze the interference and diffraction in various medium.

Mapping of COs with PSOs & POs:

ELECTRICITY & ELECTROMAGNETISM

(For Students admitted from the Academic Year 2022-2023 onwards)

Objective: To grasp the principles of laws of electricity and magnetism and to acquire experimental skills to construct & design technically useful devices.

Unit 1 Electricity: (18 hrs)

Coulomb's Law – Electric Field and Electric dipole (Basic Concepts) – Electrostatic Potential – Gauss law-Coulomb's law - Capacitors – Capacitance of a Parallel Plate Capacitor – Effect of Introducing Dielectric Slab between the Plates – Energy of a Charged Capacitor – Loss of Energy due to Sharing of Charges – Capacitors in Series and in Parallel – Carey Foster Bridge – Determination of temperature co-efficient of the resistance- Potentiometer – Calibration of Ammeter and Voltmeter.

Unit 2 Magnetic Effects of Electric Current: (18 hrs)

Lorentz force - Biot – Savart's Law - Magnetic induction at a point due to a straight conductor carrying current – Magnetic induction at any point on the axis of a solenoid - Ampere's circuital Law – Force on a current carrying conductor in a magnetic field – Force experienced by an electron moving in a magnetic field – Torque on a current loop in a uniform magnetic field – Moving coil Ballistic galvanometer – Current and voltage sensitiveness of a moving coil galvanometer - Measurement of charge sensitiveness (Figure of merit of BG) –Comparison of two capacitances using B.G.

Unit 3 Magnetic Properties of Materials & Electromagnetic Induction: (18 hrs)

Magnetic Properties of Materials: Magnetic Induction – Magnetisation – Relations between the three magnetic vectors B, H and M – Magnetic Susceptibility – Magnetic Permeabiity – Properties of Diamagnetic – Paramagnetic – Ferromagnetic materials.

Hysteresis – Experiment to draw M.H. curve (Horizontal method) – Energy dispersion in cycle – Importance of Hysteresis curve – Choice of magnetic material

Electromagnetic Induction: Laws of Electromagnetic Induction – Maxwell's Equation – Self Induction – Self Inductance (L) – L of a Long Solenoid – Mutual Induction – Mutual Inductance (M) – Experimental Determination of M – Coefficient of Coupling – Eddy Current – Uses

Unit 4 Transient & Alternating Currents: (18 hrs)

Transient Currents: DC Circuits– Growth and Decay of Current in a Circuit Containing L and R – Growth and Decay of Charge in a Circuit Containing C and R –growth of charge in a circuit inductance , capacitance and resistance.

Alternating Currents: Peak, Mean, and RMS Values of Alternating Current and Voltage– AC Circuits Containing R only, L only, C only –LCR Series Resonance Circuits – Power in AC Circuits – Power Factor – Watt Less Current – Choke – Principle and Construction– Transformer – Construction – Theory– No Load - on Load Conditions – Energy Losses– Uses.

Unit 5 AC Bridges & Maxwell's Equations: (18 hrs)

AC Bridges: General Principle – Maxwell's Bridge – Owen's Bridge – Anderson's Bridge

Maxwell's Equations: Introduction – Displacement Current – Maxwell's Equations in Material Media – Physical significance of Maxwell's Equations – Plane Electromagnetic Waves in Free Space – Determination of Velocity of Light – Poynting Vector.

TEXT BOOKS:

1. Murugeshan, R., Electricity and Magnetism - Chand & Co., New Delhi, 2017.
   Unit I 1.1 -1.4, 1.6, 2.2, 3.1, 4.1, 4.5 (4.5.1 & 4.5.2), 4.6, 4.9 & 4.11, 6.7 & 6.8.
   Unit II 10.1 – 10.3, 10.6, 10.7, 10.9-10.13, 10.15
   Unit III 11.1 – 11.4, 11.15– 11.19, 11.22, 14.1 – 14.8, 14.16, 14.18, 14.19.
   Unit IV 12.1 – 12.3 & 12.6., 13.1-- 13.3, 13.5 – 13.7.
   Unit V 13.18, 13.19, 11.6, 15.1-15.4, 15.7, 15.8.

Course outcomes

On completion of the course, the students will be able to

CO 1: explain various phenomena of electrostatics and current electricity.
CO 2: Illustrate the basic concepts of electromagnetism and their applications.

CO 3: distinguish between self induction (L) and mutual induction (M) and also determine the values of L and M.

CO 4: construct AC and DC circuits and analyse their parameters.

CO 5: design various AC bridges and generate the physical significance of Maxwell's equations.

ALLIED PHYSICS - II:
(For Mathematics students)
MODERN PHYSICS, ELECTRICITY & MAGNETISM AND ELECTRONICS
(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives:
To provide knowledge on modern physics, electronics, electricity & magnetism for mathematics students.

Unit 1: Atomic Physics (9 hrs)
Atom model - vector atom model - various quantum numbers – coupling - Pauli's exclusion principle (def) –Magnetic dipole moment due to orbital motion of electron - spin - Stern and Gerlach experiment.

Unit 2: Nuclear Physics (9 hrs)
Nuclear model - liquid drop model, shell model - mass defect, binding energy (def) - Nuclear fission and fusion - chain reaction – atom bomb - nuclear reactor

Unit 3: Theory of Relativity (9 hrs)
Frame of reference - Galilean transformation equations - Postulates of special theory of relativity- Lorentz transformation equations- length contraction, time dilation - mass energy equivalence.

Unit 4: Electricity & Magnetism (9 hrs)
Capacitor - energy of a charged capacitor - loss of energy due to sharing of charges – Biot-Sarvart's law – magnetic induction at a point on the axis of a circular coil- electric circuit switches and its types - fuses, circuit breaker and relay.

Unit 5: Electronics (9 hrs)
Basic Electronics: PN junction - Zener diode – characteristics - LED - Common Emitter Transistor amplifier (Principle). Digital Electronics: AND, OR, NOT, NAND, NOR gates - NAND and NOR gates - universal building blocks - De Morgan's theorem.

Books for Study:
1. R. Murugesan (2016) Allied Physics, First Edition, S. Chand and Co., New Delhi-110005.

Books for Reference:
1. Brijlal and Subramanyan (2002), Properties of Matter, S Chand Publication, New Delhi.
2. NN Bhargava, DC Kulshreshtra, SC Gupta, (1984). Sixteenth Edition, Basic Electronics and Linear Circuits, Tata McGraw-Hill Publishing Co., New Delhi.
3. Malvino and Leach, 1986 Digital Principles and Applications, – 4thEdn. Tata McGraw - Hill,

Course Outcomes

On completion of the course, the students will be able to,

CO 1: Understand the structure of atom and various quantum numbers
CO 2: Acquire knowledge on the nuclear model.
CO 3: Explain the concepts of relativity.
CO 4: Elucidate the ideas on electricity and magnetism.
CO 5: Illustrate working of semiconductor devices.

Mapping of COs with PSOs &POs:

Class	**: B.Sc. Physics**	**Part**	**: III Core**
Semester	**: I & II**	**Total hours**	**: 90 (45 per sem.)**
Subject Code	**: 22UPYP12**	**Credit**	**: 3**

PHYSICS LAB – I

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives

- To determine the physical properties of matter such as mechanical, thermal, optical and electrical properties, calibration of electrical instruments

Any 14 of the following list of experiments:

1. Young's Modulus - Uniform bending – Pin & Microscope
2. Young's Modulus - Uniform bending – Optic lever & Telescope.
3. Young's Modulus - Non-Uniform bending – Pin & Microscope
4. Young's Modulus - Non-Uniform bending – Optic lever & Telescope.
5. Young's Modulus - Cantilever
6. Torsion Pendulum - Rigidity Modulus and M.I of the disc
7. Compound Pendulum – Acceleration due to gravity
8. Specific heat capacity of liquid - Method of Cooling
9. Thermal conductivity – Lee's disc method
10. Spectrometer -μ of solid prism
11. Spectrometer -μ of hollow prism
12. Spectrometer - Dispersive power of a prism
13. Sonometer - Frequency of the tuning fork
14. Potentiometer – Calibration of Low range voltmeter
15. Potentiometer – Calibration of Ammeter
16. Dipole Moment of a magnet - Tan C method
17. Comparison of dipole moments – Tan A, Tan B simultaneous method
18. Potentiometer – Resistance and Specific resistance
19. Moving coil Galvanometer – Current and voltage sensitiveness
20. Thermo emf - Moving Coil Galvanometer

Course Outcomes

On completion of the course, the students will be able to

CO1: Calculate the Young's Modulus and Rigidity Modulus of the materials using various methods

CO2: Determine acceleration due to gravity using compound pendulum

CO3: Perform optical experiments to determine the refractive index and dispersive power

CO4: Carryout the experiments to calculate Thermo emf, Thermal conductivity and Specific heat capacity

CO5: Construct the electrical circuit to measure current and voltage sensitiveness, resistance and specific resistance and to calibrate ammeter and voltmeter

PHYSICS LAB

I Maths (Aided and SF)

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To study the characteristics of Zener diode, Transistor and single stage amplifier.
- To evaluate the properties of solid materials using young's modulus, compound pendulum and torsion pendulum.
- To construct Hartley oscillator, Bridge rectifier and study their parameters.
- To construct electronic logic gates using ICs, study their performance and verify theorems using logical gates.
- To study the experimental methods of spectrometer, Lee's disc, Air wedge and Ballistic galvanometer.

Any 14 of the following list of experiments:

1. Young's Modulus - Uniform bending – Pin & Microscope
2. Young's Modulus - Uniform bending – Optic lever & Telescope.
3. Young's Modulus - Non-Uniform bending – Pin & Microscope
4. Young's Modulus - Non-Uniform bending – Optic lever & Telescope.
5. Torsion Pendulum - Rigidity Modulus and M.I of the disc
6. Compound Pendulum – Acceleration due to gravity
7. Comparison of Viscosities of two Liquids – Burette method
9. Thermal conductivity – Lee's disc method
10. Air Wedge – Thickness of thin wire
11. Spectrometer – Grating – Normal Incidence method
12. Ballistic Galvanometer - Current & voltage sensitiveness
13. Series resonance circuit - Resonant frequency, Self-inductance (L), Q-factor & Band width
14. Bridge Rectifier with filter – Determination of voltage regulation factor
15. Zener diode – V-I Characteristics- Voltage regulation
16. Transistor Characteristics –CE mode
17. Single stage amplifier _ CE mode – construction & measurement of Voltage gain
18. Hartley Oscillator – frequency of Oscillations
19. Logic Gates _ AND, OR,NOT,NAND, NOR Gates using IC's
20. Demorgan's theorem – Verification using IC's

Course Outcomes

On completion of the course, the students will be able to

CO1: Study the characteristics of Zener diode, Transistor and single stage amplifier

CO2: Evaluate the properties of solid materials using young's modulus, compound pendulum and torsion pendulum.

CO3: Construct Hartley oscillator, Bridge rectifier and study their parameters.

CO4: Construct electronic logic gates using ICs, study their performance and verify theorems using logical gates.

CO5: Study the experimental methods of spectrometer, Lee's disc, Air wedge and Ballistic galvanometer

ARUL ANANDAR COLLEGE (AUTONOMOUS), KARUMATHUR
DEPARTMENT OF PHYSICS

PROGRAMME SPECIFIC OUTCOME (PSO)

PSO1: Apply the basic concepts of physics principles for the applications in scientific, industrial, communication, medical, energy and environmental fields.

PSO2: Acquire the problem solving skills and experimental skills keeping in mind the needs of the society and environment.

PSO3: The ability to formulate, conduct, analyze, interpret the theory and experiments in Physics effectively as an individual or a leader for a group.

PSO4: Develop the experimental tools with numerical techniques with an understanding of physics concepts.

PSO5: Demonstrate and communicate theoretical and experimental Physics ideas to the society.

Arul Anandar College (Autonomous), Karumathur

Department of Physics

Class	**: B.Sc. Physics**	**Part**	**: III Core-3**
Semester	**: III**	**Hours**	**: 90**
Subject Code	**: 19UPYC33**	**Credit**	**: 6**

BASIC ELECTRONICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To acquire the basics of complex circuits via various network theorems.
- To apply the concept of diode as rectifier circuit such as full and half wave rectifiers.
- To explain the fundamental principles and working of semiconductor devices.
- To classify the amplifier circuits and oscillators and their types.
- To discuss optoelectronic devices, operational amplifier (op amp) and its applications.

Unit 1 Network Analysis (18 hours)

Superposition Theorem - Voltage source and Current Source - Thevenin's Theorem - Norton's Theorem - Maximum Power Transfer Theorem - h parameters - h parameters of an ideal CE transistor

Unit 2 Solid State Devices - I (18 hours)

Ideal diode - Clipping and Clamping Circuits - Positive and Negative clipping - Positive and Negative clamping - Zener Diode - Characteristics -Zener Diode as Voltage Regulator - Full-Wave Bridge Rectifier - Filter Circuits - Shunt Capacitor Filter - Voltage Multiplier - Doubler - Tripler

Unit 3 Solid State Devices - II (18 hours)

DC Load Line - Quiescent Point - Stability factor - Methods of biasing -Emitter Feed Back Bias - Universal Divider Bias. FET - Working Principles of JFET - Output Characteristics of JFET - Working Principles of UJT -Application of UJT as an oscillator-SCR -Working Principles

Unit 4 Amplifiers and Oscillators (18 hours)

Amplifiers - Common Base and Common Collector - Amplifiers (Basics only) Common Emitter Type - Voltage Gain - Frequency Response -Amplifier Classification based on biasing condition - Push Pull Amplifier.

Oscillators - Feedback Principle - Types of Feedback - Advantage of Negative Feed Back - Barkhausen Criterion - Hartley, Colpitt and Phase Shift Oscillators - Multivibrators - Astable - Monostable - Bi-stable Multivibrators

Unit 5 Optoelectronics and Operational Amplifiers (18 hours)

Optoelectronics - LED - Photovoltaic Devices - Photo Diodes

OP-AMP - Characteristics - Non Inverting Amplifier - Inverting Amplifier -Expressions for Gain - Concept of Virtual Ground - Applications as Adder, Subtractor, Differentiator, Integrator and Comparator.

Text Book:

1. Theraja. B.L, 2012, Basic Electronics, S.Chand and Co., New Delhi.
   Unit I - Ch 4.2- 4.9, 21.14, 21.18.
   Unit II - Ch.14.4, 14.13-14.17, 15.1-15.2, 17.8, 17.9, 17.11, 17.24-17.27.
   Unit III - Ch.20.1, 20.2, 20.3, 20.5, 20.8, 20.10, 20.13, 26.1-26.6, 27.1-27.4.
   Unit IV - Ch.22.2, 22.4, 22.5, 22.6, 22.7 23.9.22.13, 22.24, 25.1-25.3, 28.1-28.14.28.21, 28.22, 29.6-29.10.
   Unit V – Ch.16.1- 16.3, 16.6 - 16.11, 31.18-31.3.

4. Grob& Schultz, 2003, Basic Electronics, 9th ed., Tata McGraw Hill.

Course outcomes

On completion of the course, the students will be able to

CO 1: Understand the complex circuits via various network theorems.

CO 2: Apply the basics of diode to describe the working of rectifier circuits such as Full and half wave rectifiers.

CO 3: Illustrate the principles and working of semiconductor devices.

CO 4: Classify the amplifier circuits and oscillator principles and its types.

CO 5: Discuss ideal operational amplifier (op amp) and design different application circuits using op amp.

ALLIED PHYSICS - 3: (For Chemistry students)

MECHANICS, PROPERTIES OF MATTER AND THERMAL PHYSICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course objectives:

- To acquire the basics of waves, harmonic motion and acoustics
- To enrich knowledge on elasticity and other properties of matter
- To study the principles of thermal physics and properties of heat engines
- To understand the principles of electricity and magnetism
- To obtain knowledge on the propagation of light rays and geometrical properties of optics

Unit 1: Waves and Oscillations (9 Hrs.)

Simple harmonic motion - laws of transverse vibrations of strings - Melde's string - transverse and longitudinal modes - ultrasonic's - production - application and uses - reverberation - factors for good acoustics of hall and auditorium.

Unit 2: Properties of Matter (9 Hrs.)

Elasticity - different moduli of elasticity - poisson's ratio - energy stored in a stretched wire - bending of beam -Young's modulus by uniform and non - uniform bending - torsion pendulum - determination of rigidity modulus by torsional pendulum. Viscosity: Streamline flow and turbulent flow - Coefficient of viscosity.

Unit 3: Thermal Physics (9 Hrs.)

Postulates of the kinetic theory of gases – van der waals equation of states -Joule - Kelvin effect - porous plug experiment. Laws of thermodynamics - heat engine - entropy - change of entropy in reversible and irreversible processes.

Unit 4: Electricity and Magnetism (9 Hrs.)

Capacitor - energy of a charged capacitor - loss of energy due to sharing of charges – BiotSarvart's law – magnetic induction at a point on the axis of a circular coil- electric circuit switches and its types - fuses, circuit breaker and relay.

Unit 5: Geometrical Optics (9 Hrs.)

Refraction- Refraction through a thin prism – dispersion through a prism- expression for the dispersive power of material of a thin prism - combination of two prisms to produce dispersion without deviation - direct vision spectroscope - defects of images-coma- - spherical aberration in lens – methods of minimizing spherical aberration - chromatic aberration in lens - removal of chromatic aberration.

Books for Study:

1. R. Murugesan (2016) Allied Physics, First Edition, S.Chand and Co., New Delhi-110005.
   Unit 1 : 1.1, 1.5 – 1.7, 1.9, 1.11 – 1.19
   Unit 2 : 2.1 – 2.7, 2.12-2.15
   Unit 3 : 3.1, 3.2, 3.4 – 3.6, 3.15 – 3.21
   Unit 4 : 4.1 – 4.3, 4.5, 4.6, 4.16 - 4.20
   Unit 5 : 5.1, 5.10 – 5.14, 5.16 – 5.19, 5.21 – 5.25

Books for Reference:

1. Brijlal and Subramanyan (2002), Properties of Matter, S Chand Publication, New Delhi.
2. Bhargava, DC Kulshreshtra, SC Gupta, (1984). Sixteenth Edition, Basic Electronics and Linear Circuits, Tata McGraw-Hill Publishing Co., New Delhi.

Course outcomes

On completion of the course, the students will be able to

CO 1: Describe the wave nature

CO 2: Explain the properties of elastic bodies with experiments.

CO 3: Characterize the basic concepts of thermodynamics.

CO 4: Interpret the change of entropy.

CO 5: Understand the ideas on electric circuits and fuses.

CO6: Analyze the dispersion of light through various medium.

POPULAR PHYSICS – (elective for arts students)

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To explain the basic physical phenomenon light and sound
- To gain knowledge on various sources of energy
- To understand the basics of communication
- To enlighten the idea about the universe and astrophysics
- To acquire knowledge on the medical instruments and their working mechanism

Unit 1 Light and Sound (9 hours)

Nature of light – Sources of light – Properties of light – Velocity of light - Rainbow, Blue of sky (introductory ideas) – Electromagnetic spectrum

Nature of sound waves – Characteristics of sounds – Velocity of sound - Echo – Acoustics of buildings- SONAR - Lightening and thunder

Unit 2 Energy Physics (9 hours)

Different forms of energy – Conventional and non-conventional energy sources – Solar energy - Wind energy – Tidal energy – Nuclear energies – Hydrogen energy – Applications

Unit 3 Communications (9 hours)

Type of communications– Communication satellites – Components of a satellite – Radar – Fiber optics - fibre optic communication – advantages

Unit 4 Astrophysics (9 hours)

The Universe - Solar system – The Sun – The Planets – Satellites– The Seasons–Standard time - Lunar eclipse – Solar eclipse.

Unit 5 Medical Physics (9 hours)

Parts & Defects of eyes – Body temperature and Blood pressure – Ultrasounds and its uses in medicine – Lasers and its applications in medicines - Bloodless surgery

Text Books:

1. Popular Physics, Department of Physics, Arul Anandar College, Karumathur.

References:

1. R. Murugesan (2016) Allied Physics, First Edition, S.Chand and Co., New Delhi-110005.
2. Rai, G.D., 2005, Non-conventional sources of Energy-4th Ed., Khanna Publishers, New Delhi.
3. Abell, Morrison and Wolf, 1987, Exploration of the Universe, 5th ed., Saunders College Publ.
4. John R. Cameron and James G. Skofronick, 1978, Medical Physics, John Willy & Sons

Course Outcome

On completion of the course, students should be able to

CO 1: develop knowledge and an understanding of fundamentals of light.

CO 2: elucidate the basic principle and types of energy generation.

CO 3: understand the components of satellite and fibre optical communication.

CO 4: describe the objects in the solar system.

CO 5: identify the various instruments in medical Physics.

Mapping of Cos with PSOs &Pos:

Arul Anandar College (Autonomous), Karumathur

Department of Physics

Class : B.Sc. Physics **Part : Self-Learning Course**

Semester : III **Credits : 3**

Subject Code : 19UPYSL3

SPACE PHYSICS

(Self-Learning Course - Offered by Department of Physics)

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To acquire the knowledge of solar system, stars and space technology tools in astronomy.
- To understand the formation of stars and galaxies
- To describe the energy generation and properties of sun.
- To classify the different types of stars and galaxies.
- To identify the different satellites and tools

UNIT 1 Universe

Origin of universe - Steady state theory – Big bang theory – Hubble's law – Red shift – models of the universe (idea only) -Milkyway galaxy – structure - Types of galaxies: Spiral – Elliptical – Irregular.

UNIT 2 Stars

Birth of stars – Nuclear fusion reaction - Evolution of stars – Binary stars – White dwaft - Neutron stars - Black holes.

UNIT 3 Solar system

Sun – Earth – Moon – other planets – Solar and lunar eclipses –comparison of stars and planets - constellations.

UNIT 4 Satellites

Satellites – Natural and artificial satellites – Types and uses – Escape speed – orbital speed.

UNIT 5 Space Technology

ISRO – Rockets - Satellite Launching vehicles – parts – types - SLV, ASLV, PSLV and GSLV.

Books for Reference

1. Mohan Sundar Rajan, Space Today, 2012, National Book Trust of India.
2. BaidyanathBasu, An Introduction to Astrophysics, 2003, PHI
3. Krishnaswamy, K.S. 1996, Astrophysics, New Age International.
4. George O.Abell, David Morrison, Sidney C. Wolf, Exploration of the universe, 1987, Saunders College Publishing,.
5. Niclolas.A.Pananides and Thomas Arny, 1979, Introductory Astronomy, Addison Wesley Publ. Co.
6. Carrol and Ostlie, 2007, Introduction to Modern Astrophysics, 2nd ed., Pearson International.

Course Outcomes

On completion of the course, the students will be able to

CO 1: Acquire the knowledge of solar system, stars and space technology tools in astronomy.

CO 2: Describe the formation of stars and galaxies.

CO 3: Discuss the energy generation and properties of sun.

CO 4: Classify the different types of stars and galaxies.

CO 5: Analyse the characteristics of different satellites and tools.

THERMAL PHYSICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To provide students with a broad understanding of the behaviour of ideal and real gas and distinguish between them each.
- To facilitate the students understanding the laws governing the gas system through simple demonstrations.
- To enable the students comprehending various transport phenomena like viscosity,
- Thermal conductivity and self-diffusion.
- To equip the learners with the conceptualization of Stefan's law and its experimental verification.
- To demonstrate the students in determining the thermal conductivity of bad conductors.

Course Outline:

Unit 1 Ideal Gas (9 hours)

Concept of Ideal gas – Expression for the pressure exerted by a gas – Derivation of gas equation – Derivation of gas laws – Degrees of freedom – Maxwell's law of Equipartition of energy

Unit 2 Behaviour of Real Gases (9 hours)

Van der Waals' Equation – Estimation of Critical Constants - Critical Coefficient – Joule-Thomson Porous Plug Experiment – Relation between Boyle Temperature, Temperature of Inversion and Critical Temperature

Unit 3 Transport Phenomena in Gases (9 hours)

Molecular collisions – Mean free path – Expression for mean free path (Clausius' Expression) –Transport phenomena – Viscosity – Thermal Conductivity – Self Diffusion

Unit 4 Transmission of Heat-I (9 hours)

Radiation – Black Body (Definitions) – Stefan's Law – Derivation of Newton's Law of Cooling from Stephen's Law - Experimental verification of Stefan's Law – Newton's Law of Cooling – Specific Heat Capacity of a Liquid- Joule's Electrical Method

Unit 5 Transmission of Heat-II (9 hours)

Conduction – Coefficient of Thermal Conductivity – Temperature Gradient – Thermal Diffusivity – Rectilinear flow of heat along a bar-Lees' Method for Bad Conductors.

Text Books:

1. Brijlal and Dr.N.Subrahmanyam&P.S.Hemne, Revised Edition, 2015 Heat, Thermodynamics and Statistical Physics - S. Chand & Company PVT.LTD, New Delhi.
   Unit 1: 1.2, 1.4, 1.8, 1.9, 1.18, 1.19
   Unit 2: 2.8, 2.10, 2.12, 2.21, 2.25
   Unit 3: 3.1, 3.2, 3.5, 3.7, 3.8, 3.11, 3.16
   Unit 4: 8.1, 8.6, 8.12, 8.20, 8.21, 8.22, 14.5, 14.6
   Unit 5: Ch.15.1, 15.2, 15.10,

3. Murugeshan, R., 2002, Mechanics, Properties of Matter, Sound and Thermal Physics - 1st edition.

Course outcome

On completion of the course, the students will be able to

CO1: distinguish the behaviour of ideal gas and real gas.

CO2: discuss the various laws of gases

CO3: comprehend various transport phenomena like viscosity, thermal conductivity and self-diffusion.

CO4: explain Stefan's law and its experimental verification.

CO5: determine the thermal conductivity of bad conductors.

CLASSICAL AND RELATIVISTIC MECHANICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To understand the concept of forces, conservation theorems and constraints.
- To deduce the equations of motion in Lagrangian dynamics and to solve some simple applications
- To analyse Hamilton equation by comparing it with Lagrangian and to use it in some applications
- To elaborate different frames and discuss the concept of ether
- To interpret the ideas of special and general theory of relativity.

Unit 1 Mechanics of a System of Particles (9 hours)

External and Internal force, Centre of Mass – Conservation of Linear momentum – Conservation of Angular momentum –Conservation of Energy (K.E., P.E.) - Conservation theorem – (Example: Box Train)

Constraints: Examples – Generalized Coordinates (Transformation Equations), Principle of Virtual Work – D'Alembert's Principle.

Unit 2 Lagrangian Formulation (9 hours)

Lagrangian Equations from D'Alembert's Principle (Derivation) – Procedure for formation for Lagrange's equation – Applications (Newton's equations of motion from Lagrange's equations, Simple Pendulum, Atwood's Machine, Compound Pendulum, Lagrange's equations for L-C circuit, Motion under central force), Lagrangian Equations in presence of Non-Conservative force.

Unit 3 Hamiltonina Formulation (9 hours)

Hamiltonian Function H and conservation of energy(Jacobi's Integral) – Physical significance, Hamilton's Equations (Derivation) –Applications (Harmonic oscillator, motion of a particle in central force field, Compound Pendulum, Two-Dimensional Harmonic Oscillator (Cartesian coordinates only).

Unit 4 Relativistic Mechanics I (9 hours)

Frame of Reference – Galilean Transformation – Ether Hypothesis – Michelson and Morley Experiment – Explanation of Negative Result.

Unit 5 Relativistic Mechanics II (9 hours)

Postulates of Special Theory – Lorentz Transformation Equations – Length Contraction – Time Dilation – Meson Decay – Simultaneity of Events – Addition of Velocities –General Theory of Relativity – An Outline - Gravitational Red Shift.

5. French, A.P., Special theory of relativity, Van NostranRainhold Company.

Course Outcomes

On completion of the course, students should be able to

CO 1: understand the concepts of forces, conservation theorems and constraints.

CO 2: deduce the equations of motion in Lagrangian and Hamiltonian dynamics

CO 3: solve some simple applications

CO 4: analyze the motion of different bodies in different frames of reference

CO 5: interpret the ideas of special theory of relativity.

ALLIED PHYSICS - IV:

(For Chemistry students)

OPTICS, ELECTRICITY, MODERN PHYSICS AND ELECTRONICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To enlighten the idea of physical optics
- To enrich knowledge on atomic physics
- To understand the nuclear structure and the evolution of nuclear models
- To study the concepts of the formulations of theory of relativity
- To explain universal electronic building blocks and understand De Morgan's theorem

Unit 1: Physical Optics (9 hrs)

Interference – Interference in thin films - air wedge - determination of diameter of a thin wire by air wedge - Diffraction - theory of transmission grating- Normal incidence - polarization- double refraction- Nicol prism.

Unit 2: Atomic Physics (9 hrs)

Atom model - vector atom model - various quantum numbers – coupling- Pauli's exclusion principle (def) –Magnetic dipole moment due to orbital motion of electron - spin - Stern and Gerlach experiment.

Unit 3: Nuclear Physics (9 hrs)

Nuclear model - liquid drop model, shell model - mass defect, binding energy (def) - Nuclear fission and fusion - chain reaction – atom bomb - nuclear reactor

Unit 4: Theory of Relativity (9 hrs)

Frame of reference - Galilean transformation equations - Postulates of special theory of relativity- Lorentz transformation equations- length contraction, time dilation - mass energy equivalence.

Unit 5: Electronics (9 hrs)

Basic Electronics: PN junction - Zener diode – characteristics - LED - Common Emitter Transistor amplifier (Principle). Digital Electronics: AND, OR, NOT, NAND, NOR gates - NAND and NOR gates - universal building blocks - De Morgan's theorem.

Books for Study:

1. R.Murugesan (2016) Allied Physics, First Edition, S.Chand and Co., New Delhi-110005.

Books for Reference:

1. Brijlal and Subramanyan (2002), Properties of Matter, S Chand Publication, New Delhi.
2. NN Bhargava, DC Kulshreshtra, SC Gupta, (1984). Sixteenth Edition, Basic Electronics and Linear Circuits, Tata McGraw-Hill Publishing Co., New Delhi.
3. Malvino and Leach, 1986 Digital Principles and Applications,– 4thEdn. Tata McGraw - Hill,

Course Outcomes

On completion of the course, the students will be able to

CO 1: Enumerate the interference, diffraction and polarization.

CO 2: Understand the structure of atom and various quantum numbers

CO 3: Demonstrate the nuclear reactor.
CO 4: Explain the concepts of relativity.
CO 5: Illustrate working of semiconductor devices.

BASICS OF APPLIED PHYSICS (For other science students)

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To gain knowledge on the various heating elements and working mechanism
- To enlighten the basics of the communication systems
- To analyze thermal properties and the characters of light
- To understand the basic physics principles involved in various medical equipment
- To explain various cosmological objects and phenomenon in astrophysics

Unit 1 **(9 hours)**

Heating Effects of electric current

Joule's law of heating - materials for heating elements- applications of heating effect: (Incandescent lamps - electric iron - water heater- electric kettle) – Fuses

Unit 2 **(9 hours)**

Communication Physics:

Types of Communication – Satellite Communication – RADAR – Optical fibre communication.

Unit 3 **(9 hours)**

LASER:

Characteristics of LASER – Principle of Spontaneous and Stimulated Emission – Population Inversion – Pumping - Applications.

Unit 4 **(9 hours)**

Medical Physics:

Defects of vision in Eyes – Body temperature and Blood Pressure – Ultrasonography – X-Ray – MRI – ECG – Endoscope – Bloodless Surgery.

Unit 5 **(9 hours)**

Astrophysics:

The Universe – Our Solar system: (The Sun, Planets and Natural Satellites) – The Seasons (Meteorological Seasons and Astronomical Seasons) – Eclipses (Lunar and Solar Eclipses)

TEXT BOOKS:

Course outcome

On completion of the course, students should be able to

CO 1: understand the functions of various heating sources in day today life.

CO 2: realize the basic principle of various types of communication.

CO 3: discuss the working of Laser system and its applications.

CO 4: comprehend the functions of different instruments in medical Physics.

CO 5: describe the objects in the solar system.

PHYSICS LAB – II

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives

- To determine the M and BH using Tan A and Tan B positions.
- To measure the charge, current, voltage and thermo emf sensitiveness using B.G.
- To find the field along the axis of the coil using deflection magnetometer and vibration magnetometer
- To calculate the optical properties like wavelength, refractive index and Cauchy's constant using spectrometer experiments.
- To carry out the electrical experiments toperformV-I characteristics, voltage regulation, single stage RC coupled amplifier, Hartley oscillator, Voltage doubler and tripler.

Any 14 of the following list of experiments:

1.Field along the axis of the coil – Vibration magnetometer
2. Determination of M and BH – Tan A and Tan B
3. Potentiometer – Calibration of high range voltmeter
4. B.G. – Current and voltage sensitiveness
5. B.G. – Charge sensitiveness
6. B.G – Thermo emf
7. Spectrometer – i-d curve
8. Spectrometer – i-i' curve
9. Spectrometer – grating – normal incidence method
10. Spectrometer – grating – oblique incidence method
11. Spectrometer – Cauchy's constant
12. Newton's rings – radius of curvature
13. Bridge rectifier – with pi filter
14. Field along the axis of the coil – deflection magnetometer
15. Zener diode – V-I characteristics, Voltage regulation
16. Single stage RC coupled amplifier – CE mode
17. Hartley oscillator
18. Voltage doubler and tripler
19. Transistor static characteristics – CE mode

Course Outcomes

On completion of the course, the students will be able to

CO1: Find the M and BH using Tan A and Tan B positions.

CO2: Measure the charge, current, voltage and thermo emf sensitiveness using B.G.

CO3: Determine the field along the axis of the coil using deflection magnetometer and vibration magnetometer

CO4: Measure the optical properties like wavelength, refractive index and Cauchy's constant using spectrometer experiments.

CO5: Carryout the electrical experiments toper form V-I characteristics, voltage regulation, single stage RC coupled amplifier, Hartley oscillator, Voltage doubler and tripler.

Mapping of Cos with PSOs & POS:

Subject Code	**: 19UPYR24**	**Credits:**	**2**

PHYSICS LAB

I Maths (Aided and SF)

(For Students admitted from the Academic Year 2019-2020 onwards)

Course outcomes

On completion of the course, the students will be able to

- To determine the wavelength and thickness using optical instruments.
- To calculate the Young's modulus of the given material.
- To measure the thermal conductivity of materials and to construct electric circuits for rectifiers and resonance
- To measure the centre of gravity and rigidity modulus.
- To verify the working of various logic gates and theorems.

Any 14 of the following list of experiments:

1. Young's Modulus - Uniform bending – Pin & Microscope
2. Young's Modulus - Uniform bending – Optic lever & Telescope.
3. Young's Modulus - Non-Uniform bending – Pin & Microscope
4. Young's Modulus - Non-Uniform bending – Optic lever & Telescope.
5. Torsion Pendulum - Rigidity Modulus and M.I of the disc
6. Compound Pendulum – Acceleration due to gravity
7. Comparison of Viscosities of two Liquids – Burette method
9. Thermal conductivity – Lee's disc method
10. Air Wedge – Thickness of thin wire
11. Spectrometer – Grating – Normal Incidence method
12. Ballistic Galvanometer - Current & voltage sensitiveness
13. Series resonance circuit - Resonant frequency, Self-inductance (L), Q-factor & Band width
14. Bridge Rectifier with filter – Determination of voltage regulation factor
15. Zener diode – V-I Characteristics- Voltage regulation
16. Transistor Characteristics –CE mode
17. Single stage amplifier _ CE mode – construction & measurement of Voltage gain
18. Hartley Oscillator – frequency of Oscillations
19. Logic Gates _ AND, OR,NOT,NAND, NOR Gates using IC's
20. Demorgan's theorem – Verification using IC's

Course outcomes

On completion of the course, the students will be able to

CO 1: Determine the wavelength and thickness using optical instruments.

CO 2: Calculate the Young's modulus of the given material.

CO 3: Find the thermal conductivity of materials and Construct simple electric circuits

CO 4: Measure the centre of gravity and rigidity modulus.

CO 5: Analyze and verify the various logic gates and theorems.

Novel Materials– (Self learning course)

(For Students admitted from the Academic Year 2019-2020 onwards)

Objective : To understand the properties and applications of novel materials

Course Objectives

- To explain the properties of glass material and its properties.
- To acquire knowledge on metals and alloys.
- To study on composite materials and its properties.
- To illustrate the chemical structure and property of biomaterials,
- To describe the properties of chemical sensors for various applications

Unit-1 Glass-Ceramics

Kinetic and thermodynamic criteria for glass formation, types of glasses and their chemical compositions, Physical properties of glasses, Nucleation and crystal growth in glasses, nucleation through micro miscibility, nucleating agents, properties and applications of glass-ceramics.

Unit-2 Metals & Alloys

Brief overview of commercial metals and alloys and their crystal structures. General properties of metals and alloys. Processing: Casting, solidification, powder metallurgy, hot workability, sheet metal forming, welding, elementary ideas of rolling, forging and extrusion. Carbon and alloy steels, Al, Ni, Zn, Ti, Mg based alloys.

Unit-3 Composite Materials

Composite Materials Types of composites and their advantages. Reinforcements: Glass, boron, carbon, organic and ceramic fibers, their structure, properties and processing.

Unit-4 Biomaterials

Introduction to biomaterials for biomedical applications, Chemical structure and property of biomaterials, Degradation of biomaterials, Polymeric biomaterials: Introduction, preparation, hydrogel biomaterials, Bio conjugation techniques, Biomaterials for drug delivery application

Unit-5 Chemical Sensors

Introduction to chemical sensing; Potentiometry: fundamental principles, membrane potentials, Applications of potentiometry: ion-selective electrodes, amperometry, glucose sensors in diabetes: more enzyme electrodes, immunosensors, ELISA, piezoelectric devices: quartz crystal microbalance, luminescent sensors and electrochemical luminescence.

References

1. Gladius Lewis, “Selection of Engineering Materials”, Prentice Hall Inc. New Jersey USA, 1995.
2. Principles of Polymer Science, Bahadur and Sastry, Narosa Publishing House 2002.

Course Outcomes

On completion of the course, the students will be able to

CO1: Describe the properties of glass material and its properties.

CO2: Acquire knowledge on metals and alloys.

CO3: Discuss on composite materials and its properties.

CO4: Illustrate the chemical structure and property of biomaterials,
CO5: Explain the properties of chemical sensors for various applications

MODERN PHYSICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives

- To acquire the concepts of dual nature and quantum theory of light
- To enrich the knowledge on wave function, wave equations and operators.
- To analyse the physical importance of various atomic models.
- To understand the concepts of magnetic dipole moment, coupling schemes and selection rules.
- To study the magnetic and electric field effects by Zeeman and Stark effects

UNIT I Dual Nature (15 hours)

Photoelectric Effect – Quantum Theory of Light – Work function -Compton Effect. De Broglie Waves Particle Diffraction – Davisson - Germer experiment – Uncertainty Principle – I and II

UNIT II Quantum Mechanics (15 hours)

Wave function-Normalization- Well-behaved Functions-Wave Equations- Partial Derivatives-Schrodinger time dependent Equations- Validity-Linearity and superposition-Expectation Values-Operators (Momentum and Energy)-Schrodinger's Equation: Steady state-Eigen values and Eigen functions.

UNIT III Atomic models (15 hours)

Rutherford Alpha Particle Scattering Theory – Bohr Model (No Theory) – Origin of Hydrogen Spectra – Somerfield's Model with Theory – Fine Structure of H-Alpha Line – Vector Atom Model – Quantum Numbers – L-S and j-j Coupling – Pauli Exclusion Principle– Periodic Classification – Electronic Configuration of Elements.

UNIT IV Magnetic Dipole Moment & Spectra (15 hours)

Magnetic Dipole Moment of An Electron due to Orbital and Spin Motion – Bohr Magnetron – Stern and Gerlach Experiment – Spin Orbit Coupling. Spectral Terms and Notation – Selection Rule – Intensity Rule – Interval Rule – Fine Structure of Sodium D Line – Hyperfine Structure

UNIT V Magnetic and Electric field effects (15 hours)

Zeeman Effect – Experimental Arrangement – Larmor's Theorem – Quantum Mechanical Explanation of the Normal Zeeman Effect – Anamolous Zeeman Effect – Theoretical Explanation – Lande's Factor – Explanation of Splitting of D1, D2 Lines of Sodium – Paschen Back Effect – Stark Effect (Basic Principles Only).

Course Outcomes

On completion of the course, the students will be able to

CO1: Understand the concepts of dual nature and quantum theory of light

CO2: Acquire knowledge on wave function, wave equations and operators.

CO3: Interpret the physical importance of various atomic models.

CO4: Analyze the magnetic dipole moment, coupling schemes and selection rules.

CO5: Illustrate the magnetic and electric field effects by Zeeman and Stark effects

OPTICS AND SPECTROSCOPY

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To understand the basics on interference.
- To enrich knowledge on diffraction.
- To clarify the effects of polarization.
- To understand the basics of spectroscopy.
- To compare the IR and Raman Spectra.

UNIT I Interference (15 hours)

Huygen's Principle – Coherent Sources – Young's Experiment – Interference Fringes – Intensity Distribution in the Fringe System – Fresnel's Biprism – Determination of Wave Length –Michelson's Interferometer – Air Wedge – Experiment – Newton's Rings – Determination of λ and μ – Fabry Perot Interferometer.

UNIT II Diffraction (15 hours)

Fresnel and Fraunhofer Diffraction – Diffraction at a Straight Edge –Plane Transmission Diffraction Grating – Theory and Experiment – Normal and Oblique Incidence – Absent Spectra – Overlapping of Spectral Lines – Dispersive Power of Grating – Resolving Power of a Prism and Plane Transmission Grating – Comparison of Prism and Grating Spectra.

UNIT III Polarization (15 hours)

Polarization by Reflection – Polarizing Angle and Brewster's Law – Polarization by a Pile of Plates – Law of Malus – Polarization by Dichroic Crystals – Double Refraction – Optic Axis – Principal Section and Planes – Polarization by Double Refraction – Nicol Prism – Parallel and Crossed Polarizers – Refraction by Calcite Prisms.

UNIT IV Introduction to Spectroscopy (15 hours)

Characterization of Electromagnetic Radiation – The Quantization of Energy – Region of the Spectrum – Frequency, Wave Number and Wavelength – Types Energy Possessed by Molecules – Width and Intensity of Spectral Lines – Microwave Spectroscopy – Rotation of Molecules – Rotational Spectra – Diatomic Molecules .

UNIT V IR & Raman spectroscopy (15 hours)

Infra-Red Spectroscopy – Vibrating Diatomic Molecule – Diatomic Vibrating Rotator – Vibration – Rotation Spectrum of Carbon Mono Oxide – Breakdown of the Born – Oppenheimer Approximation. Raman Spectroscopy – Discovery – Experimental Study – Characteristics of Raman Line – Quantum Theory –Raman Activity of Vibrations.

MATHEMATICAL PHYSICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To facilitate the learners to elaborate the fundamentals of Vector and Scalar fields.
- To provide the students a broad view of understanding in special type of matrices which are relevant to Physics.
- To train the students developing analytical skill in various Special functions.
- To make the students gaining knowledge on Laplace Transforms and its applications to solve differential equations.
- To equip the students to correlate measures of Central tendency and Dispersion.

Course Outline

Unit I: Vector Analysis (15 hrs)

Gradient of a scalar field – Line, Surface and Volume integrals – Divergence of a vector function – Expression for divergence in Cartesian Co-ordinates – Curl of a Vector function – Expression for Curl in Cartesian Co-ordinates – Gauss divergence theorem – Stoke's theorem – Green's theorem.

Unit II: Matrices (15 hrs)

Types of Matrices – Eigen values, Eigen vectors: Characteristic equation of a matrix – Cayley Hamilton theorem – Diagonalization of Matrices – Inverse of a matrix – Non-homogeneous Linear equations – Cramer's rule for solving non-homogenous linear equations.

Unit III: The Beta, Gamma Functions and Differential Equations (15 hrs)

Beta function: Definition, Symmetry property, Evaluation and other forms – Gamma function: Definition, Evaluation and other forms – Relation between Beta and Gamma functions – Bessel's differential equation – Legendre's differential equation.

Unit IV: Laplace Transforms (15 hrs)

Laplace Transforms: Definition – Laplace Transform of Derivatives, Integrals, Gamma function – The Inverse Laplace Transform: Definition – Convolution theorem – Applications of Laplace Transforms.

Unit V: Statistics (15 hrs)

Arithmetic Mean – Properties of the Arithmetic Mean – Median – Quartiles – Deciles – Percentiles – Mode – Empirical relation between Mean, Median and Mode – Geometric Mean – Harmonic Mean - Range – The Mean Deviation – Standard Deviation – Mean Square Deviation – Relation between Standard Deviation and Root Mean Square Deviation.

DIGITAL ELECTRONICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives

- To understand and examine the structure of various number systems and their applications.
- To analyse various combinational and sequential circuits.
- To explain and compare the working of multivibrators using IC 555
- To identify basic requirements for circuit design.
- To develop skill in writing simple program for 8085 and its applications

Unit I Number systems, codes & Arithmetic Circuits (15 hours)

Binary number system – Binary to decimal conversion – Decimal to binary conversion – Octal numbers – Hexadecimal numbers – The ASCII code – the excess 3 code – the gray code- Binary Addition – Binary Subtraction – 2's complement Representation – Arithmetic Building Blocks (Half Adder & Full Adder) – Binary Multiplication and Division

Unit II Digital Principles &Combinational Logic Circuits (15 hours)

Digital Logic: (The Basic Gates – NOT, OR, AND, UNIVERSAL LOGIC GATES – NOR, NAND) boolean Laws and theorems – sum of products method – Truth table to Karnaugh map – Pairs, Quads & octets – Karnaugh Simplification – Don't care condition – Product of sums method – Multiplexers and De-Multiplexers – (Principles only) – Decoders & Encoders (Principles only)

Unit III Timing Circuits and Flip flops (15 hours)

555 Timer – (Astable, Monostable) – RS Flip flop – Gated Flip Flops (clocked RS flip Flops only) – Edge triggered D – Flip Flops - Edge triggered JK Flip Flops, JK Master slave flip flops

Unit IV Registers & Counters (15 hours)

Types of Registers – Serial IN serial OUT - Serial IN parallel OUT – Parallel IN serial OUT – parallel IN parallel OUT – Applications of Shift registers counters-Asynchronous counters – Synchronous counters-Presettable counters (Synchronous up – down counters)

Unit VMicroprocessor (15 hours)

Digital Computers – Intel 8085 block diagram – Data and address bus – Pin configuration – Intel 8085 instructions – Opcode and operands –Addressing modes – Instructions- Assembly language programs – Addition of two 8 – bit numbers – 8-bit subtraction – One's complement of 8 bit number – Two's complement of 8-bit number – 8-bit multiplication.

Teaching Learning Methods:

- Lecture Method, Demonstration, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

CO1: Understand and examine the structure of various number systems and their applications in digital design.

CO2: Analyse various combinational and sequential circuits.

CO3: Explain and compare the working of multivibrators using IC 555

CO4: Identify basic requirements for circuit design and propose a cost-effective solution.

CO5: Develop skill in writing simple program for 8085 and its applications

Mapping of COs with PSOs & POs:

SEMESTER V	**Subject Code:**								**Title of Paper: Digital Electronics**					**Sum of COs with PSOs and POs**
Course Outcomes (CO'S)	**Programme Outcomes (PO'S)**								**Programme Specific Outcomes (PSO'S)**

ASTROPHYSICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives

- To acquire the knowledge of telescopes and its applications in astronomy
- To acquire the knowledge of solar system objects
- To enrich the idea about sun and its activities
- To analyse the properties of stars and their evolution
- To classify the galaxies and the other stellar objects

Unit I Solar System **9 Hours**

Solar System -Motion of the Earth -Seasons -Latitudes and Longitudes –Types of Planets - Solar Eclipse -Lunar Eclipse -Asteroids and Meteoroids -Comets – Origin of moon – Lunar craters

Unit II The Sun and its Activities **9 Hours**

The Sun -Internal Layers of the Sun -Atmospheres of the Sun – photosphere – chromosphere – corona -Solar Activities –sunspots – coronal holes – coronal mass ejections – solar flares – radio bursts – plages, faculae and granules - Sun-Earth relationship -Future of the Sun - Estimation of surface temperature of the Sun -Solar wind

Unit III Stars and their evolution **9 Hours**

Nuclear reactions in star -Properties of stars -Classification of stars -Birth of stars – Hertzprung-Russel diagram -Main sequence stars -Life time of main sequence stars -Stellar evolution -How long Sun shine? –Constellations - Binary Stars - Star Clusters

Unit IV Galaxies and Universe **9 Hours**

Milkyway Galaxy -Other galaxies -Types of galaxies -Galactic clusters -Cosmology -Origin of Universe -Expanding Universe -Cosmic Microwave Background -Density and Shape of Universe -White dwarf -Quasars and Neutron stars -Black hole

Unit V Tools of Astronomy **9 Hours**

Introduction-Optical Telescopes – Refracting and reflecting telescopes - Comparison of Galilean and Keplerian telescopes -Image – resolving power – magnification power - Aberrations -Spectroscope -Radio Telescopes -Astronomical scales -Multiwavelength Astronomy -Comparison of optical and radio astronomy -Some optical and radio observatories in India

Text Books:

1. Shanmugaraju, A., 2019, Introduction to Astrophysics, Arul Anandar College, Karumathur, Madurai.

References:

4. Krishnaswamy, K.S. 1996, Astrophysics- A modern perspective, New Age International.

Teaching Learning Methods:

- Lecture Method, Models, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

CO 1: Acquire the knowledge of solar system, stars, galaxies and tools in astronomy.
CO 2: Describe the occurrence of seasons on the earth and effects of solar activities on the Earth.
CO 3: Discuss the energy generation, properties of inner and outer layers of sun.
CO 4: Analyse the evolution of stars, properties of stars and galaxies.
CO 5: Acquire the knowledge about optical and astronomical telescopes

INFORMATION TECHNOLOGY

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives

- To understand the basics of modulation concepts in telecommunication.
- To acquire the knowledge of TV, Radio & fibre optics in communication systems.
- To illustrate the working of Internet and World Wide Web.
- To describe the basics of E-mail and its uses.
- To discuss the principles of E-commerce and its growth.

UNIT – I: INTRODUCTION TO TELECOMMUNICATION (9 hours)

Introduction – Analog and Digital signals – Modulation – Types of Modulation – Pulse Modulation Techniques – Digital Modulation – Modems – Computer Network – Over view of a Network – Communication Processors – Communication Media – Video / Voice Communication – Video Conferencing – Telecommunication Software – Types of Networks – Network Topologies – Network Protocols – Network Architecture.

UNIT – II: COMMUNICATION SYSTEMS (9 hours)

Introduction – Radio – Television – Microwave systems – Communication satellite – Radar – Fiber Optics – ISDN.

UNIT – III: INTERNET & WORLD WIDE WEB (9 hours)

Introduction –What special about Internet – Internet access – Internet Basics – Internet Protocols – Internet addressing – World Wide Web (WWW) – Web Page & HTML – Web Browser – Searching the web – Internet chat.

UNIT – IV: ELECTRONIC MAIL (9 hours)

Introduction – Why use E-mail – How Private is a E-mail – How E-mail works? - E-mail Names & Address – Mailing Basics - E-mail Ethics – Internet code of conduct – Spamming - E-mail Advantages and disadvantages – Tips for Effective E-mail use – Smileys (Emotions) – Useful E-mail services – Mailing Lists – News groups.

UNIT – V: EDI – VIRTUAL OFFICE (9 hours)

Introduction – Business-to-Business E-commerce – Virtual shop – Digital Middleman – what kind of E-commerce to use.

Book for Study

Alexis Leon and Mathews Leon, 2009, Fundamental of Information technology, USB Publishers distribution Ltd.

Unit 1: Chapter 17.1 – 17.9, Chapter 18.1 – 18.12

Unit 2: Chapter 19.1 – 19.14; Unit 3: Chapter 21.1 – 21.26

Unit 4: Chapter 22.1 – 22.20; Unit 5: Chapter 27.1 – 27.4

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course outcomes

On completion of the course, the students will be able to

CO 1: Acquire the various modulation methods and concepts of telecommunication.

CO 2: Explain the communication systems like TV, Radio & fibre optics.
CO 3: Discuss the concepts of Internet and world wide web.
CO 4: Describe the process of E-mail and its uses.
CO 5: Analyse the features of E-commerce and virtual shop.

Department of Physics
INTERNSHIP
(For those who joined in June 2019 onwards)

Class	**: B.Sc. PHYSICS**	**Part**	**: IV**
Semester	**: V**	**Duration**	**: 25 days**
Subject Code	**: 19UINT15**	**Credits**	**: 1**

Objectives:

- To practice in a different learning experience
- To gain laboratory/industry/research experiences
- To acquire the employability skills

Outline

- The students shall undertake their internship from IV/V semester holidays and must submit the report and attendance certificate before the external examinations of VI semester.
- The students must periodically report their progress and status to their respective Staff-In-charge / supervisor.
- The students must complete their internship of 25 days by undertaking any one of the following ways
    - The students shall work as intern in any of the related forums of their feasibility such as laboratory/industry/research centers/institutions etc.
    - The students shall participate in the internship programs offered by other Institutions / Colleges / Universities.
    - The students shall work under faculty of other colleges and acquire exposure to any of the topics in physics.

Evaluation:

Internal - 50 marks
Progress Report and Viva

External – 50 marks
Competent person of the laboratory/industry/research centers/institutions

Total – 100 marks

Arul Anandar College (Autonomous), Karumathur

Department of Physics

Class	**: B.Sc. PHYSICS**	**Part**	**: Self Learning Course**
Semester	**: V**	**Hours**	**:**
Subject Code	**: 19UPYSL5**	**Credit**	**: 3**

THIN FILM SCIENCE

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives

- To understand the growth mechanism of thin films
- To study the preparation of various thin films by chemical deposition methods
- To describe the growth of various thin films by physical deposition methods
- To examine the properties of thin films using different instruments
- To discuss the use of thin films in different industrial applications.

Unit -I Introduction

Classifications of Thick film, thin films, nano films and ultrathin films; Nucleation & Growth: capillarity theory, atomistic and kinetic models of nucleation, basic modes of thin film growth, stages of film growth & mechanisms.

Unit-II Growth Techniques- Chemical deposition methods

Sol- Gel method, Spray Pyrolysis, Electrodeposition, Chemical bath deposition.

Unit-III Growth Techniques-Physical deposition methods

Thermal Evaporation, E-Beam Evaporation, Sputtering, Pulsed laser deposition

Unit-IV Characterization Techniques

X-ray diffraction, UV-Visible, FT-IR, Raman and Photoluminescence spectroscopy, SEM technique.

Unit-V Applications

Applications of nano films as functional coatings (wear resistant, optical coatings etc.), data storage (CDs and DVDs), sensors, magnetic storage, transparent conducting oxides, photovoltaic solar cells etc.

Reference books

1. Introduction to Thin films, K. Ravichandran, K. Swaminathan, B. Sakthivel, Research India publications, New Delhi, (2013).
2. Nanocoatings and Ultra-Thin Films: Technologies and Applications, 1st Edn., A.S.H. Makhlouf and I. Tiginyanu,Woodhead Publishing, (2011).
3. Thin Film Fundamentals: A. Goswami-New age International, 2007.
4. Thin Film Phenomena, K. L. Chopra, McGraw Hill Inc. (1969)

Teaching Learning Methods:

- Self - learning, Discussion

Course Outcomes

On completion of the course, the students will be able to

CO1: Describe the growth mechanism of thin films

CO2: Illustrate the preparation of various thin films by chemical deposition methods

CO3: Explain the growth of various thin films by physical deposition methods

CO4: Analyze the properties of thin films using different instruments

CO5: Discuss the use of thin films in different industrial applications.

THERMODYNAMICS AND STATISTICAL MECHANICS
(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives

- To understand the concepts of transmission of heat and related experiment
- To study the thermodynamics concepts by Laws of thermodynamics.
- To elaborate the concepts of change in entropy and its applications in phase transition
- To explain the classical statistics distribution functions and their applications
- To acquire knowledge in quantum statistics and compare all the three statistics.

Unit I Transmission of Heat (15 hours

Introduction - Conduction – Coefficient of Thermal Conductivity – Temperature Gradient – Thermal Diffusivity – Lees' Method for Bad Conductors. Radiation – Black Body (Definitions) – Stefan's Law – Derivation of Newton's Law of Cooling from Stephen's Law - Experimental verification of Stefan's Law – Newton's Law of Cooling – Specific Heat Capacity of a Liquid-Joule's Electrical Method

Unit II Thermodynamics I (15 hours)

Distribution of Energy in the spectrum of a Black Body – Wien's Displacement - Rayleigh Jeans Laws - Planck's Law – Solar Constant – Temperature of the sun - Solar Spectrum Derivation –Deduction of Wien's, Rayleigh Jeans Laws – Zeroth law, First Law & Second Law of Thermodynamics (Statement only)

Unit III Thermodynamics II (15 hours)

Entropy – Change in Entropy - Change in Entropy in adiabatic process- Change of Entropy in reversible Cycle – Principle of increase of Entropy -Change of Entropy in an Irreversible Processes–The T-S Diagram– Physical significance of Entropy -Entropy of a Perfect Gas – Third Law of Thermodynamics- Maxwell's Thermodynamical Relations – Thermodynamic Potentials (Definition only) – First Order Phase transition and Second Order Phase transition (Definition only) – Helium I and II.

Unit IV Classical Statistics (15 hours)

Fundamentals of Postulates of Statistical Mechanics – Density of quantum states of Energy of Particles- Statistical Ensembles – Kinds of Particles- Ideal gas - Statistical Equilibrium – Maxwell Boltzmann Energy Distribution Law - Maxwell Boltzmann Distribution Law in General form- Maxwell Boltzmann Distribution Function for an Ideal Gas.

Unit V Quantum Statistics (15 hours)

Introduction – Bose Einstein Distribution Law – Photon Gas - Fermi Dirac Distribution Law – Electron Gas –Comparison of the three Statistics.

Text Books:

NUCLEAR PHYSICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To facilitate the learners in understanding the basic nuclear properties and applications of NMR.
- To equip the students in enumerating different nuclear models.
- To inculcate the students with the knowledge of Particle accelerators& Detectors.
- To assist the learners in explaining various nuclear reactions and properties of neutron.
- To strengthen the students' basic knowledge on nuclear energy and elementary particles.

Course Outline:

Unit 1 Nuclear Structure I (15 hours)

Nuclear Composition – Atomic masses – Nuclear electrons - Some nuclear properties – Spin and Magnetic moment – Applications of NMR (Proton NMR, C_{13} NMR) – Nuclear Magnetic Resonance - Stable nuclei – Nuclear decay - Binding Energy – Binding energy per nucleon – Strong interaction.

Unit 2 Nuclear Structure II (15 hours)

Liquid Drop Model – Corrections to the formula - Shell Model – Magic numbers – Reconciling the models – Island of stability - Nuclear Forces –Meson Theory of Nuclear Forces – Discovery of the pion - Nuclear Matter – Two nucleon potential – Qualitative features of the nuclear forces.

Unit 3 Detectors, Accelerators & Radio activity (15 hours)

Nuclear Radiations – GM Counter – Bubble Chamber – Scintillation Counters – Particle Accelerators – Betatron – Synchrotrons (Electron, Bevatron). Radioactivity – Radioactive Series – Radioactive Equilibrium –Velocity and Range of Alpha - Geiger Nuttal Experiment – Geiger Law – Geiger Nuttal Law –Origin of the Line and Continuous Spectrum – Neutrino Theory of Beta Decay – K Electron Capture

Unit 4 Nuclear Reactions & Neutron (15 hours)

Energy Balance and Q Value – Threshold Energy – Nuclear Transmutations by Alpha Particles – Protons – Deuterons – Neutrons and Electron –Neutron – Discovery – Production – Mass – Spin – Charge – Magnetic Moment – Neutron Diffraction – Biological Effects – Absorption by Matter – Classification – Neutron Sources – Neutron Detection.

Unit 5 Nuclear energy & Elementary particles (15 hours)

Fission -Energy Release – Bohr and Wheeler Explanation by Drop Model – Nuclear Fusion – Source of Stellar Energy –Thermonuclear Reactions – Hydrogen Bomb - Elementary Particles – Baryons – Hyperons – Leptons – Mesons – Particles and Antiparticles – Fundamental Interaction – Elementary Particle Quantum Numbers – Conservation Laws and Symmetry – Quark Model – Composition of Hadrons – Colored Quarks – Generations.

Text Books:

1. Arthur Beiser, Shobhit Mahajan, S.Rai Choudhury, 2010, Concepts of Modern Physics, 6th edition, McGraw Hill, New Delhi.

(Unit I – Ch.11 & Unit II – Ch.11)

3. Arthur Beiser, 1987, Concepts of Modern Physics, McGraw Hill, Singapore.
4. Devanathan. V, 2006, Nuclear Physics, Narosa Publishing House, New Delhi.

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course Outcomes:

On completion of the course, the students will be able to

CO1: Understand the basic nuclear properties and applications of NMR.

CO2: Enumerate the different nuclear models.

CO3: Acquire the knowledge of Particle accelerators & Detectors.

CO4: Explain various nuclear reactions and properties of neutron.

CO5: Gain the basic knowledge of nuclear energy and elementary particles.

SOLID STATE PHYSICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives

- To understand the basics of crystal structure of various materials.
- To appreciate the correlation between bonding and the properties of solids.
- To discuss the energy levels and energy-level spacing of a free electron in metals.
- To acquire knowledge on magnetism and magnetic materials.
- To classify the types of superconductors and their applications

Unit 1 Elements of Crystallography (15 hours)

Introduction – Some Fundamental Definitions in Crystallography – Miller indices – Lattice Parameters of an Unit Cell – Crystal Structures of Important Engineering Materials and Stacking Sequences – Other important structures (diamond, Zinc blende, NaCl, CsCl) – Polymorphism and Allotrophy.

Unit 2 Bonding in solids &Thermal Properties of Solids (15 hours)

Introduction – Interatomic Forces and Cohesive Energy – Different Types of Bonds in Solids – Lattice Energy of Cohesive Energy of Ionic Crystals.

Specific Heat Capacity of Solids – Einstein's Theory of Specific Heat Capacity – Debye's Theory of Specific Heat Capacity of a Solid.

Unit 3 Electron theory of metals (15 hours)

Introduction – the classical free electron theory – Electrical conductivity of a metal (based on Drude and Lorentz theory) – the quantum free electron theory – band theory of solids – derivation of ohm's law – thermal conductivity.

Unit 4 Magnetic properties (15 hours)

Introduction – Origin of Magnetic Moment in Magnetic Materials – Magnetic Quantities – Different Types of Magnetic Material – Langevin Theory of Paramagnetism – Weiss Theory of Paramagnetism – Weiss Theory or Molecular Field Theory of Ferro Magnetism.

Unit 5 Superconductivity (15 hours)

Introduction – Explanations for the Occurrence for Superconductivity – General Properties of Superconductors – Other General Observations – Types of Superconductors – High Temperature Superconductors – Single Particle Tunneling – Josephson Effect (AC & DC) – Applications of Superconductors.

Text Books:

1. Arumugam, M, 2004, Solid State Physics, Anuratha Agencies, Kumbakonam.
   (Unit I – Chap 2- Secs 2.1 – 2.6.
   Unit II - Chap.1 Secs.1.1 – 1.4
   Unit III – Chap.6 Secs. 6.1 – 6.5, 6.9 – 6.10
   Unit IV – Chap.8 Secs. 8.1 – 8.8 (8.7.1. excluded)
   Unit V – Chap.10 Secs. 10.1 – 10.5.1, 10.10 – 10.12
2. Murugesan, R., 2003, Modern Physics, S. Chand and Company, New Delhi.
   Unit II– Chap.16 Secs.16.10 – 16.12

Teaching Learning Methods:

- Lecture Method, Models Display, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

CO1: Understand the crystal systems and structure of various materials.

CO2: Correlate the bonding with the properties of solids.

CO3: Calculate the energy levels and energy-level spacing of a freeelectrons in metals.

CO4: Acquire knowledge on magnetism and magnetic materials.

CO5: Analyze the types of superconductors and their applications.

Mapping of COs with PSOs & POs:

NANOPHYSICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To understand the basics of Nanomaterials, Classification and its properties.
- To discuss the various types of quantum materials, Nanotubes and nanostructures.
- To explain different techniques of preparation of nano materials and their advantages.
- To illustrate nanomaterial characteristic tools and its basic concepts.
- To describe the applications of nanomaterials in various fields.

Unit 1: Introduction to Nanotechnology (15 Hours)

History of nanotechnology – Classification of Nanomaterials – Properties of Nanomaterials – Effects of surface area to volume ratio on the properties of materials – Applications of Nanomaterials – Challenges in nanotechnology.

Unit 2: Nanomaterials (15 Hours)

Quantum dots – Quantum wires – Quantum well – Fullerenes – Buckminster fullerene – Carbon nanotubes: Properties –Synthesis: Plasma arc-discharge method – Laser ablation technique – Chemical vapour deposition – Applications of carbon nanotubes. Nanocomposites – Nanohybrids – Nanoclusters and Nanoparticles

Unit 3: Preparation of Nanomaterials (15 Hours)

Top down and bottom up approaches – Top down techniques: Ball Milling – Etching – Nanolithography – Photolithography – Combustion synthesis. Bottom up techniques: Vacuum evaporation technique – Sputter deposition process – Laser ablation – Co-precipitation process – Hydro-thermal method – Sol-gel synthesis.

Unit 4: Characterization Techniques (15 Hours)

X-ray Diffraction: Principle – Instrumentation – Determination of structural parameters. Scanning electron microscope (SEM) – Transmission electron microscope (TEM) –Energy Dispersive X-ray Analysis (EDAX) - UV-Visspectroscopy:Some important optical parameters – Photoluminescence (PL) spectroscopy.

Unit 5: Applications of Nanomaterials (15 Hours)

Nanoelectronics – Molecular electronics – Nanophotonics – Nanorobotics – Nano mechanics–Band gap engineered quantum devices - Photo-electrochemical cells – Plasmonic wave guides – CNT emitters – Gold nanoparticles in catalystis.

Biomedical applications:Targeted drug delivery – Cancer therapy – Targeted chemotherapy – Radiation Therapy – Thermotherapy – Immunotherapy – Photodynamic therapy – Anti-angiogenic therapy – Gene therapy – Tissue engineering – Biosensing – Bioimaging.

Text Book:

4. Nanotechnology and Nanoelectronics, W.R.Fahrner (Ed.), Springer (2008)
5. Exploring Nanomaterials, R.Pazhani, Pooja publishers, Ethamozhy (2009).

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course Outcomes:

On completion of the course, the students will be able to

CO1: Acquire the knowledge of nanomaterials and their properties

CO2: Elucidate and compare various quantum confinements and nanotubes

CO3: Describe the preparation of nano materials using different techniques

CO4: Analyse different characteristics of nanomaterials.

CO5: Classify the various applications of nanomaterials.

BASIC ELECTRIC PRINCIPLES AND APPLICATIONS
(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To acquire the knowledge on basics of electricity & fundamental laws.
- To enrich knowledge on heating effects of electric current.
- To compare the uses of different lamps.
- To understand the basics of Transformers.
- To describe the generation and transmission of electricity.

Unit I Nature of electricity and fundamental laws (12 hours)

Nature of electricity- electronic theory-flow of electric current –electron drift- electrical circuit- path of electric current –types of electric circuits –electrical terms (definition)- direct current- alternating current –laws of resistance – variation in resistance with temperature-combination of resistances –ammeter- voltmeter. work, power, energy.

Unit II Heating effects of electric current (12 hours)

Heating effects of electric current,Joule's law of heating- thermal efficiency- heating unit- materials for heating elements- applications of heating effect (incandescent lamp, arc welding, electric heaters, room heater, soldering iron, air circulator, electric kettle, electric iron, water heater: immersion water heater, storage water heater). Fuse (classification, parts, types)-precautions for renewing a fuse.

Unit III Illumination (12 hours)

Definitions and units, laws of illumination, incandescent lamps. Different types of lamps- gas filled lamp, carbon arc lamp, gas discharge lamp, sodium vapour lamp, mercury vapour lamp, fluorescent tube; used of choke and starter, Neon- light tubes and neon lamps- solar cells.

Unit IV Transformer (12 hours)

Introduction- principle- types of transformers-construction –cooling of transformer- step up transformer- step down transformer- advantages of transformer- uses.

Unit V Generation and transmission of electricity (12 hours)

Generation of Thermal power, hydro power, nuclear power and non – conventional power, transmission of power.

Text Books:

1. P.S.Dhogal, 1986, Basic electrical engineering, Vol -I, Tata McGraw-Hill Publishing Company limited.
   UNIT I – Ch.3, 4 (relevant sections); UNIT II – Ch.5 (relevant sections)
2. P.S.Dhogal, 1986, Basic electrical engineering ,Vol- II, Tata McGraw – Hill Publishing Company limited.
   UNIT III – Ch. 20(relevant sections); UNIT IV- Ch.14 (relevant sections)
   UNIT V- Ch 24 (relevant sections)
3. G.D RAI, 1988, Non- conventional energy sources, Khanna Publications.
   UNIT V- Ch 1 (relevant sections)

2. B.L .THERAJA, A.K THERAJA, 2002, Electrical technology, S.Chand& Company Ltd, New Delhi.

Teaching Learning Methods:

- Lecture Method, Demonstration, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

CO 1: Acquire knowledge on the nature of electricity and fundamental laws.
CO 2: Apply the knowledge of the heating effects of electric current in various fields.
CO 3: Understand the illumination and application in different lamps.
CO 4: Discuss the concept of transformers.
CO 5: Explain the generation and transmission of electricity.

MEDICAL PHYSICS

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To understand basic human physiological system and simple medical instruments
- To explain the designing and working of bio signal amplifiers and recorders
- To elaborate the concepts behind physiological assist devices and understand its importance
- To interpret the working of specialized medical equipment
- To comprehend the principles of modern medical imaging systems

UNIT I: BIOPOTENTIAL ELECTRODES AND TRANSDUCERS (12 Hrs)

Transport of ions through cell membrane - Bio electric potential - Design of medical instruments - Electrodes - Micro & Surface - Transducers (active, passive, resistive transducers only).

UNIT II: BIO SIGNAL AMPLIFIERS AND RECORDERS (12 Hrs)

Isolation amplifier - Medical pre amplifier design - Chopper amplifier (Mechanical and non-mechanical chopper)- Bio signal analysis (Analog and digital methods, signal to noise improvement) - Characteristics of recording systems (writer and pen damping effects) - Electrocardiography (origin of cardiac action potential) – Encephalography (origin of EEG) - Electromyography (recording setup) –Recorders with high accuracy.

UNIT III: PHYSIOLOGICAL ASSIST DEVICES (12 Hrs)

Pace makers (energy requirements to excite heart muscle)- Artificial heart valves (requirements, different neutral heart valve, different types of artificial heart valve)– Defibrillators (internal and external) - Nerve and muscle stimulators (stimulation of nerves) - Heart lung machine (mechanical function of heart) - Kidney machine (renal function and dialysis).

UNIT IV: SPECIALIZED MEDICAL EQUIPMENTS (12 Hrs)

Blood flow meters (EM blood flow meter, Principle only) - Gas analysers (IR gas analyser)– Oximeters (vitro and vivo) - Blood cell counters - Electron microscope - Radiation detectors (Geiger muellar counter only) - Photometers and calorimeters (filter, spectrophotometer) - Digital thermometers - Audio meters (Human air) - X-ray tube - X-ray Machine (Block diagram of X-ray machine only).

UNIT V: MODERN IMAGING SYSTEMS (12 Hrs)

Lasers in medicine (laser action only) - Endoscopes - Cryogenic Surgery - Nuclear imaging Techniques - Computer Tomography (principle only) - Thermography (IR) - Ultrasonic imaging system (principle only) - Magnetic resonance Imaging(principle only) - Positron emission tomography - Digital subtraction angiography.

Text Book

Dr. M. Arumugam - Bio medical Instrumentation - Anuradha Publication - 2016.

Unit – I Chapter –1: 1.4, 1.6

Chapter–2: 2.2, 2.4, 2.4.5, 2.4.7, 2.5, 2.5.1 – 2.5.7

Unit – II Chapter –3: 3.3, 3.4, 3.8, 3.8.1, 3.8.2, 3.9, 3.9.1, 3.9.2

Chapter –4: 4.2, 4.2.1, 4.3, 4.3.1, 4.4, 4.4.1, 4.5, 4.5.1, 4.7

Unit – III Chapter –5: 5.2, 5.2.1, 5.4, 5.4.1, 5.4.2, 5.4.3, 5.5, 5.5.1, 5.6, 5.6.1, 5.7, 5.7.1,5.8, 5.8.1, 5.8.2

Unit – IV Chapter –6: 6.10, 6.10.1, 6.13, 6.13.1, 6.15

Chapter –7: 7.2, 7.4, 7.5, 7.5.1, 7.5.2, 7.6, 7.7, 7.8, 7.9

Unit – V Chapter –10: 10.3, 10.4, 10.5, 10.6, 10.7, 10.8, 10.8.1, 10.9, 10.10, 10.11, 10.12

Books for Reference:

1. R. S. Khandpur - Handbook of Biomedical Instrumentation - Tata McGraw-Hill, New Delhi - 1999.
2. Leslie Cromwell, Fred J. Weibell& Erich A. Pfeiffer - Biomedical Instrumentation and Measurements, II edition - Prentice Hall of India Private Limited, New Delhi - 2003.

Teaching Learning Methods:

- Lecture Method, Demonstration, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

CO1: Understand the simple medical instruments

CO2: Explain the working of bio signal amplifiers and recorders

CO3: Discuss the basic concepts of physiological assist devices

CO4: Interpret the working of specialized medical equipment

CO5: Compare the various modern medical imaging systems

PHYSICS LAB – III (General)

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives

- To determine certain physical properties through optical experiments
- To carry out the electrical experiments to find and compare the inductance of coils, impedance, emf and capacitances.
- To construct electrical circuits to measure the thermo emf, temperature coefficient and to find the resonance frequency characteristics.
- To perform ballistic & tangent galvanometer experiments to study the electric and magnetic parameters
- To determine the dielectric constants of air, solid and liquid.

Any 15 of the following list of experiments:

1. Determination of thickness of a wire by Air wedge
2. Determination of Hartmann's formula - spectrometer
3. Determination of Small angle prism - spectrometer
4. Determination of ifor d, d for i - - spectrometer
5. Determination of self-inductance of a coil by Owen's bridge
6. Determination of self-inductance of a coil by Anderson's bridge
7. Determination of emf of a thermocouple by Potentiometer
8. Determination of temperature coefficient of resistance Potentiometer
9. Determination of Impedance and power factor – LR circuit
10. Determination of Galvanometer – conversion of ammeter
11. Determination of Galvanometer – conversion of voltmeter
12. Determination of comparison of emf of two cells by B.G.
13. Determination of comparison of capacitances by B.G.
14. Determination of absolute capacitance by B.G.
15. Determination of mutual inductance by B.G.
16. Determination of Horizontal component of Earth's magnetic field – Tangent Galvanometer
17. Determination of B-H Hysteresis Curve
18. Determination of LCR – series resonance circuit
19. Determination of LCR – Parallel resonance circuit
20. Determination of Dielectric constants of air, solid and liquid

Teaching Learning Methods:

- Lecture Method, Demonstration, ICT, Hands-on session.

Course Outcomes

On completion of the course, the students will be able to

CO 1: Perform optical experiments to determine the thickness of a thin wire and optical parameters

CO 2: Carry out the electrical experiments to calculate the self-inductance of coils, impedance and power factor.

CO 3: Construct electrical circuits to measure the thermo emf, temperature coefficient and resonance frequency.

CO 4: Illustrate the working of ballistic & tangent galvanometer and to study the electric and magnetic parameters

CO 5: Determine the dielectric constants of air, solid and liquid.

PHYSICS LAB – IV (Electronics)

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Objectives:

- To study the various characteristics of operational amplifier IC 741.
- To construct and determine the bandwidth using single stage and two stage amplifiers.
- To construct multivibrators and compare the theoretical and experimental frequency.
- To execute the arithmetic operations of 4 bit and 8-bit microprocessor kit.
- To analyse and verify the various logic gates and theorems.

Any 14 of the following list of experiments:

1. Single stage amplifier with feedback
2. Two stage amplifier with feedback
3. Two stage amplifier without feedback
4. Clippers and clampers using diode and CRO
5. Colpitt's oscillator
6. Monostablemultivibrator using transistor
7. Schmitt trigger – IC 555
8. Astablemultivibrator using transistor
9. Opamp – IC 741 - characteristics
10. Opamp – IC 741 – differentiator and integrator
11. Opamp – IC 741 – adder and subtractor
12. Logic gates using discrete components
13. Logic gates using ICs
14. Logic gates – using IC universal gates
15. Logic gates – Ics – Demorgan's theorem
16. Logic gates - ICs – Boolean expressions
17. XOR and XNOR – Using ICs
18. Half adder and full adder
19. R-S, J-K and D flip-flops
20. Mod 5 and Mod 10 counters
21. Ring counters
22. Shift registers
23. Microprocessor – 8085 – perform addition, subtraction
24. Microprocessor – 8085 – perform 1's and 2's complement subtraction
25. Microprocessor – 8085 – perform multiplication and division

Teaching Learning Methods:

- Lecture Method, Demonstration, ICT, Hands-on session.

Course Outcomes

On completion of the course, the students will be able to

CO 1: Study the various characteristics of operational amplifier IC 741.

CO 2: Calculate the gain and bandwidth using single stage and two stage amplifiers.

CO 3: Construct multivibrators and compare the theoretical and experimental frequency

CO 4: Perform the arithmetic operations of 4 bit and 8 bit microprocessor kit.

CO 5: Analyze and verify the various logic gates and theorems.

OPTICAL COMMUNICATION

(For Students admitted from the Academic Year 2019-2020 onwards)

Course Outcomes

On completion of the course, the students will be able to

- To acquire knowledge on the fiber optic communication systems.
- To understand the concept of propagation of light in optical fibres.
- To compare the different types of fibres and modes.
- To explain the basics of semiconductors.
- To describe the working of LEDS and various forms of optical communications.

UNIT I

Introduction –forms of communication system –the evolution of the fiber optic system-elements of an optical transmission link

UNIT II

The nature of the light –linear polarization – the quantum nature of light –basic optical laws and definitions –Propagation of light in different media-Propagation of light waves in an optical fiber

UNIT III

Basic structure of an optical fiber and Propagation of light wave through it – Numerical Aperture –Numerical Aperture of a graded index fiber -Modes of optical fiber -Optical fiber modes and configurations – fiber types –rays and modes –step index fiber structure –ray optics representation.

UNIT IV

Optical sources - Energy bands – intrinsic and extrinsic materials –the PN junctions - direct and indirect band gaps – semiconductor devices fabrication.

UNIT V

Light emitting diodes- The LED structures - the light source materials- semiconductor materials –transmitters design –common photo detectors – receiver design –other form of the optical communications.

Reference Books:

1. Fibre-Optics Communications Technology, Pearson Education, 2002
2. Study Material.

Teaching Learning Methods:

- Self - learning, Discussion

Course Outcomes

On completion of the course, the students will be able to

- **CO 1:** Acquire knowledge on the fiber optic communication systems.
- **CO 2:** Understand the concept of propagation of light in optical fibres.
- **CO 3:** Analyze the different types of fibers and modes.
- **CO 4:** Explain the basics of semiconductors.
- **CO 5:** Analyze the working of LEDS and various forms of optical communications.

ARUL ANANDAR COLLEGE (AUTONOMOUS), KARUMATHUR
DEPARTMENT OF PHYSICS

PROGRAMME SPECIFIC OUTCOMES (PSO)

On completion of M.Sc. Physics programme, the students will be able to,

PSO1: Comprehend the concepts of diverse fields in Physics.

PSO2: Exhibit proficiencies in applying various concepts of physics to fulfil the regional, national and global needs.

PSO3: Demonstrate experiments to analyse & interpret the concepts of physics that will enable them to shine in the field of education, research and development.

PSO4: Acquire the skills to perform collaborative inter-disciplinary activities and to undertake effective research.

PSO5: Work in the field of physics with the desire to make it as a lifelong learning process for their continued academic and professional development.

Sub.Code	**: 22PPYC11**	**Credit**	**: 5**

MATHEMATICAL PHYSICS – I

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives

To understand various mathematical techniques, concepts and applicable in physics

UNIT 1 Vectors (18 hours)

Gradient of a scalar field –Line , Surface and Volume Integrals – Gauss Divergence theorem (statement &Analytical Proof) –Gauss law in differential form – Poisson's equation and Laplace equation –Stoke's theorem (statement & Analytical Proof) –Green's theorem – Green's theorem in Plane –Orthogonal Curvilinear coordinates – Spherical Polar coordinates (Gradient, Divergence, Laplacian& Curl) - Cylindrical Coordinates (Gradient, Divergence, Laplacian& Curl) – Applications of vectors: Hydrodynamics - Equation of continuity – Equation of Heat flow in solids

UNIT 2 Vector Spaces and Transformation (18 hours)

Partitioning of Matrices – Special type of Matrices – Transpose of Matrix – Symmetric & Anti Symmetric - Hermitian and skew Hermitian – Adjoint of Matrix - Orthogonal matrices, Unitary matrices -Rank of a Matrix - Solution for Linear equation: Homogeneous, Non-Homogeneous, Creamer's rule - Linear - Orthogonal and unitary and – similarity transformations - Eigen Values, Eigen vectors: Characteristics equation of Matrix–Cayley-Hamilton theorem – Some important theorems on Eigen Values, Eigen vectors – Diagonalization of Matrices

UNIT 3 Operational Methods (18 hours)

Fourier series and Integrals: Fourier series - Dirichlet's theorem and condition – Uses of Fourier Series – Full Wave rectifier, Square Wave, Saw tooth wave - Fourier Integral –Fourier Transform – Properties of Fourier transform – Laplace Transform - Properties of Laplace transform - Laplace transform of the Derivative of function – Laplace transform of Integral - Inverse Laplace transform: Fourier Mellin theorem – convolution or Faltung theorem - Evaluation of Inverse Laplace transformby convolution theorem **–** Laplace transform of ordinary differential equation with constant coefficients and variable coefficients.

UNIT 4 Special Function I (18 hours)

Definitions: Beta and Gamma function – Symmetry property of Beta functions - Transformation of Beta function (other forms)–Evaluation of Gamma Function - Transformation of Gammafunction (other forms) – Relation between Beta and Gamma Function – Graph of Gamma Function

Bessel's Differential Equation: Bessel's function of First and second kind –Limiting value of $J_n(x)$ &$Y_n(x)$ – Recurrence formula for $J_n(x)$ – Generating function of $J_n(x)$

UNIT 5 Special Function II (18 hours)

Legendre differential equations and Legendre functions: Legendre's equation (first & second kind) –Generating function of Legendre polynomial, (corollary 1, 2) –Rodrigue's formula for Legendre polynomials, Deductions – Orthogonal Properties of Legendre's polynomials – Hermite differential equation–Laguerre's differential equation

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

CO1: Describe the concepts of vector algebra and their applications.

CO2: Analyse various types of matrices and theorems.

CO3: Develop the Fourier series expansions, Fourier and Laplace transforms for certain applications.

CO4: Demonstrate the importance of various special functions and enumerate the Generating Function for these special functions.

CO5: Perform operations with Legendre differential equations along with the corresponding recurrence formulae of different functions.

CLASSICAL MECHANICS

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives:

- To understand the classical formulation theories like Lagrangian & Hamiltonian dynamics, Canonical transformations and Oscillations and to apply them to solve problems.

UNIT 1 Lagrangian & Hamiltonian Dynamics (18 hours)

Basic concepts – Constraints – Lagrangian equation from D'Alembert's principle – Procedure for formulation of Lagrange's equation – Hamilton's Principle and Lagrange's equations - Hamiltonian equations of motion - Cyclic coordinates and Routh's procedure – Physical significance of the Hamiltonian – Hamilton's equations from variational principle – The principle of least action.

UNIT 2 Canonical Transformations, Brackets & Hamilton-Jacobi Theory (18 hours)

Canonical transformation – Generating Functions – Example of canonical transformation – Conditions for a transformation to be canonical – Lagrange and poison bracket – Equations of motion in Poison bracket notation – Hamiltonian Jacobi equation – Solution to SHM using HJ theory - Separation of variable – Action angle variable.

UNIT 3 Motion Under Central Force: Two Body Problem (18 hours)

Reduction of two body to one body problem – Central force & motion in a plane – Equations of motion – Differential equation for an orbit – Inverse square law of force – Kepler's laws of planetary motion & their deduction – Virial theorem – Scattering in a central force field – Rutherford scattering cross section.

UNIT 4 Rigid body Dynamics (18 hours)

The independent coordinates of a rigid body – Orthogonal transformation – Formal properties of the transformation – The Euler's angles – Euler's theorem on the motion of the rigid body – Finite rotation – Infinitesimal rotations – Angular momentum & Inertia tensor – Rotational kinetic energy of a rigid body – The Coriolis effect – Torque free motion of a rigid body – Motion of symmetrical top.

UNIT 5 Small Oscillations (18 hours)

Stable, unstable & neutral equilibrium – One dimensional Oscillator – Theory of small oscillations' formulation – The Eigenvalue equation - frequency of free vibration and small oscillations in normal coordinates –Vibrations of a linear triatomic molecule – Two coupled oscillators - Double pendulum.

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

CO1: Apply Lagrangian & Hamiltonian formulation to solve problems in classical mechanics.

CO2: Acquire knowledge in Canonical transformation and Hamilton-Jacobi theory.

CO3: Understand the motion under the central force and to analyze the problems related to it.

CO4: Explain the concepts of rigid body dynamics.

CO5: Discuss the frequency of vibration and small oscillations.

ELECTROMAGNETIC THEORY

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives:

- To discuss the concepts of electrostatic and magnetostatic fields, electromotive force, propagation of electromagnetic wave in waveguides

UNIT 1 ELECTROSTATICS (18 hours)

Coulomb's law; the electric field – line, flux and Gauss's Law in differential form - Gauss's law - application of Gauss's law – curl of E - the electrostatic potential; conductors and insulators - Poisson's equation; Laplace's equation –Boundary conditions – work and energy in electrostatics – energy of a point charge distribution – energy of continuous charge distribution – induced charges – capacitors. Potentials: Laplace equation in one dimension and two dimensions – Dielectrics – induced dipoles – Gauss's Law in the presence of dielectrics.

UNIT 2 MAGNETOSTATICS (18 hours)

Lorentz force – magnetic fields – magnetic forces – currents – Biot-Savart Law – divergence and curl of B – Ampere's Law – Electromagnetic induction - comparison of magnetostatics and electrostatics – Magnetic vector potential. Magnetization: effect of magnetic field on atomic orbit – Ampere's Law in magnetized materials –Magnetostatic Boundary Conditions - ferromagnetism.

UNIT 3 ELECTROMOTIVE FORCE (18 hours)

Ohm's Law – electromotive force – motional emf – Faraday's Law – induced electric field – inductance – energy in magnetic field – Maxwell's equation in free space and linear isotropic media – continuity equation – Poynting theorem- Newton's Third Law in Electrodynamics. Electromagnetic Waves in one dimension – wave equation – sinusoidal waves – reflection and transmission – Polarization

UNIT 4 ELECTROMAGNETIC WAVES (18 hours)

The wave equation for E and B – Monochromatic Plan waves – energy and momentum in electromagnetic waves – electromagnetic waves in matters – Propagation in linear media - Reflection and transmission at normal and oblique incidence - EM waves in conductors - Absorption, dispersion and reflection at a conducting surface. Potentials: potentials and fields – scalar and vector potentials – Gauge transformation – Coulomb Gauge and Lorentz Gauge – Lorentz force law in potential form - Retarded Potentials - Liénard-Wiechert Potentials.

UNIT 5 GUIDED WAVES AND RADIATION (18 hours)

Guided waves: TE waves in rectangular wave guides – the co-axial transmission line. Electric dipole radiation - Magnetic dipole radiation - Radiation from an arbitrary source -power radiated by a point charge - Radiation reaction - radiation damping of a charged particle - Physical basis of the radiation reaction

Course Outcomes

On completion of the course, the students will be able to

CO1: Discuss the concepts of electrostatic fields.
CO2: Solve the Laplace's equation in Cartesian and spherical coordinates.
CO3: Acquire knowledge on magnetostatics and vector potentials.
CO4: Analyze the propagation of EM waves in non-conductors and good conductors.
CO5: Describe the propagation of EM waves in waveguides.

ENERGY AND ENVIRONMENTAL PHYSICS (ELECTIVE)

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives:

- To study the necessary non-conventional energy sources and the need of environmental protection.

UNIT 1 Various Energy Sources and Power Production (18 hours)

World and Indian energy future – Conventional sources of energy – Coal, Oil and gas – Renewable energy sources – Wind energy – Bio-gas, OTEC – Hydro, thermal and nuclear power productions.

UNIT 2 Solar Radiation and Solar Collectors: (18 hours)

Solar energy Indian research and perspectives – Solar radiation analysis and measurement pyrheliometer and pyranometers – heat transfer in solar thermal – radiation and convection.

Principles of flat plate solar collectors – Conversion of solar radiation into heat – Transmittance & absorbance – Collector thermal losses – Energy balance equation – Overall loss coefficient – Derivation for useful energy gain and efficiency.

UNIT 3 Applications of Solar Energy (18 hours)

Solar energy storage systems – solar pond – Applications of solar pond – Solar water heating – Space heating – Solar thermal electricity conversion – Solar electricity power generation: Solar Photovoltaics – Solar distillation – Solar cooking.

UNIT 4 Fuel Cells & Super Capacitors (18 hours)

Introduction to fuel cells – Types of fuel cells – Polymer electrolyte fuel cell – micro fuel cell – Solid oxide fuel cell – Hydrogen fuel - Super Capacitors.

UNIT 5 Air and Water Pollution (18 hours)

Water and air pollution – Sources of water and air pollution – Classification of water and air pollution – Effects of water and air pollution – Purification and control devices of water and air pollution. (Design and working of settling chambers, cycline separators and gaseous pollution control methods) – Global air pollution problems.

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

CO1: Distinguish between conventional and non-conventional energy sources, enumerate the various methods of power production.

CO2: Explain the methods of measurement of solar radiation and operation of solar collectors.

CO3: Describe the various applications of solar energy.

CO4: Classify the different types of fuel cells and its applications.

CO5: Analyse the causes of air pollution and water pollution.

Mapping of COs with PSOs & POs:

NANOPHYSICS (ELECTIVE)

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives:

- To enrich the students with the foundational knowledge of size dependant properties of Nanostructures and their various applications.

Course Outline:

UNIT 1: Introduction to Physics of the Solid State and Methods of Measuring Properties (18 hrs)

Size dependence of properties – Crystal structures – FCC nanoparticles – Tetrahedrally Bonded semiconductor structures – Lattice vibrations –Crystallography – Particle size determination – Surface structure – Transmission Electron Microscopy – Field Ion Microscopy – Scanning Microscopy – IR and Raman spectroscopy Photoemission and X-ray spectroscopy – Magnetic resonance.

UNIT 2: Properties of Individual Nanoparticles (18 hrs)

Metal nanoclusters: Magic numbers – Theoretical modelling of nanoparticles – geometric structure – Electronic Structure – Reactivity – Fluctuations – Magnetic clusters – Semiconducting nanoparticles: optical properties – Photofragmentation – Coulombic explosion – Rare gas and molecular clusters: Inert gas clusters – superfluid clusters – molecular clusters – Methods of synthesis: RF Plasma – Chemical methods – Thermolysis – Pulsed Laser Methods

UNIT 3: Carbon Nanoclusters (18 hrs)

Carbon molecules: nature of the carbon bond – New carbon structures – Carbon clusters: Small carbon clusters – Structure of C_{60} and its crystal – Alkali Doped C_{60} – Superconductivity in C_{60} – Carbon nanotubes: Fabrication – Structure – Electrical properties – Vibrational properties – Mechanical properties – Applications of carbon nanotubes: Field emission and shielding – computers – fuel cells – mechanical reinforcement.

UNIT 4: Quantum Wells, Wires and Dots: (18 hrs)

Preparation of quantum nanostructures – Size and dimensionality effects: (Size effects – conduction electrons and dimensionality) – Fermi gas and density of states – potential wells – partial confinement – properties dependent on density of states – Excitons – Single-electron tunnelling – Applications: IR detectors – quantum dot lasers.

UNIT 5: Nanomachines and Nanodevices: (18 hrs)

Microelectromechanical systems (MEMSs) – Nanoelectromechanical Systems (NEMSs): Fabrication – Nanodevices and nanomachines – Molecular and supramolecular switches (Any three switches).

5. T.Pradeep, 2018, Nano: The Essentials, McGraw Hill Education (India) Private Limited, Chennai.

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussions and Group Activities.

Course Outcomes:

CO1: Gain the foundational knowledge of size dependant properties of Nanostructures and various microscopic and spectroscopic techniques.
Construct a model for Cuboctahedron

CO2: Elucidate and compare the properties of nanoclusters and enumerate various methods of synthesis of nanoparticles.

CO3: Describe Carbon nanoclusters and various properties of carbon nanotubes.

CO4: Associate the low-dimensionality effects with the change in properties.

CO5: Compare MEMSs and NEMSs and analyse the working of molecular switches.

Semester	**: II**	**Hours**	**: 90**
Sub.Code	**: 22PPYC42**	**Credit**	**: 5**

MATHEMATICAL PHYSICS-II

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives

- To understand the concepts of complex variables and complex functions.
- To apply these techniques and concepts to solve Physics problems

UNIT 1 Complex Variables (18 hours)

Complex numbers - Functions of a complex variable – Limit, continuity& differentiability – Definition: Analytic function - Cauchy – Riemann differential Equations - Line integrals of complex functions–Rectifiable curve – Basic Properties of the complex Line integrals – A Few preliminary concepts – Cauchy Integral theorem – Extension to multiple connected region - Cauchy's integral formula – Taylor's series - Maclaurin series - Laurents series

UNIT 2 Complex Analysis (18 hours)

Singularities of an Analytic function: Isolated and Types of Singularities–Residues and their evaluation: Residues – Evaluation of residues: Residues at a simple pole – Residues of a pole m>1 – The residue at infinity - Cauchy's Residue theorem–Define integrals of Trigonometric functions of $\cos\theta$ and $\sin\theta$ (integration around unit circle) – Evaluation of certain improper real integrals

UNIT 3 Tensor Analysis (18 hours)

Introduction – n-dimensional space – super scripts and sub scripts - coordinate transformations – Indicial and summation conventions – Dummy and real indices – Kronecker delta symbol – some properties – generalised Kronecker delta – scalars, , contravarient and covariant vectors – Tensors of Higher rank – contravarient, covariant and mixed tensors of second rank –Tensors of higher rank –Algebric operations of tensors: Addition, subtraction, equality of tensors, outer product – contraction of tensors – inner product – Quotient Law (Example) – symmetric and anti-symmetric tensors - Lorentz transformation equations - Lorentz transformation of space and time in four vector form

UNIT 4 Group Theory (18 hours)

Molecular symmetry – symmetry operations – Rotation about symmetry axis – Reflection at a plane of symmetry – Rotation reflection – Inversion and Identity operations –symmetry elements – Algebra of Symmetry operations – Multiplication table – Reducible and Irreducible representations – The Great Orthogonality theorem – Character table for $C_{2V}$and C_{3V} point groups

UNIT 5 Numerical Methods (18 hours)

Interpolation with unequal intervals: Divided differences – Newton's Divided difference formula - Lagrange's Interpolation formula for unequal intervals – Numerical integration – Trapezoidal rule – Simpson's 1/3 rule –Numerical solution of ordinary differential equation: Taylor's series method –Euler's method – Modified Euler's method – Runge – kutta methods: second order and fourth order Runge – kutta method

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

CO1: Describe the concept of complex functions and analyse their properties.

CO2: Discuss the singularities and residues of an analytic function and to find the integrals.

CO3: Compare various types of tensors and perform their algebraic operations.

CO4: Classify different groups and deduce the various symmetric operations in group theory.

CO5: Apply various numerical methods for scientific research-oriented problems.

QUANTUM MECHANICS – I

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives

- To get an idea about the quantum mechanical nature and understand the behaviour of particles in microscopic concepts.

UNIT 1 Wave Mechanical Concepts (18 hours)

Inadequacy of classical physics – old quantum theory – uncertainty and complementarity – The Schrodinger wave equation – one dimensional wave equation – extension to three dimensional wave equation – extension to three dimension – interpretation of the wave function – Normalization of ψ - probability current density – Particle in a box– expectation value – Ehrenfest theorem – Separation of wave equation – Continuity and bound conditions – discrete and continuous energy eigenvalues – one dimensional square well.

UNIT 2 Eigen functions and Eigen values of Some Systems (18 hours)

Energy eigenfunction – Orthonormality – Reality of energy eigenvalues – Momentum eigenfunction – box normalization – Discrete eigenvalues – LHO – spherically symmetric potential – square well-hydrogen atom – Degeneracy – Spherical polar coordinate only.

UNIT 3 Matrix Formulations (18 hours)

Concept of Hilbert space – Dirac's notation – projection operators – physical meaning of matrix element – Equations of motion – Schrodinger picture – Heisenberg picture – Interaction – Energy representation – Poisson and commutation brackets – Evaluation of commutators – Virial theorem – Matrix theory of harmonic oscillator – coordinate representation.

UNIT 4 Angular Momentum (18 hours)

The angular momentum operators– Commutation relations – Eigenvalues & Eigenfunctions of L^2&L_z–Eigenvalus of J^2&J_z - Angular momentum matrices – spin angular momentum – spin vectors for spin (-1/2) system – addition of angular momenta – Clebsch-Gordan coefficients – Recursion relations.

UNIT 5 Perturbation Theories (18 hours)

Time independent perturbation – basic concepts – non-degenerate energy levels- 1st order correction- 2nd order correction – Anharmonic oscillator: 1st order correction - Ground state of Helium - Stark effect – Degenerate energy levels – 1st order correction - The WKB method – Connection formulas – Validity of WKB Method.

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

CO1: Interpret the physical importance of wave function and wave equation.
CO2: Describe the Eigen function and Eigen value of various systems.
CO3: Discuss the matrix formulations of quantum mechanics.
CO4: Analyse angular momentum of quantum mechanical systems.
CO5: Deduce solutions of systems subjected to perturbations.

APPLIED ELECTRONICS

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives:

- To study the characteristics of Field Effect Transistor (FET), operation of Flip- Flops and their applications, architecture of operational amplifier, microprocessor & microcontroller, develop some programs for its operation and various signal conversion techniques

UNIT I Semiconductor Devices (18 hours)

Field effect transistor: The Ideal Voltage Controlled Current Source - The Junction Field Effect Transistor – The JFET Volt – Ampere Characteristics – JFET Transfer Characteristics – The MOSFET – The enhancement MOSFET Volt – Ampere Characteristics – The Depletion MOSFET – MOSFET Circuit Symbols – The DC Analysis of FETs – The MOSFET as a Resistance – Switch – Amplifier – CMOS Devices.

UNIT II Digital Electronics (18 hours)

Binary Systems – Boolean Algebra- Simplification of Boolean Functions – the Exclusive -OR, NAND, and NOR Gates – A1 bit memory – the Circuit Properties of a Bistable Latch – Flip-Flops – R-S Flip-Flop – the Clocked SR Flip- Flop – J-K Flip-Flop – the Master - Slave J-K Flip-Flop - D- Type Flip-Flop – Shift Registers – Ripple (Asynchronous) counters – Synchronous Counters – Applications of Counters. K-map (Four Variable)

UNIT III Operational-Amplifier (18 hours)

Op. Amp – Architectures – The Gain Stage with Active Load – the Differential Stage – DC level Shifting – Output Stages – Offset Voltages and Currents – Measurements of Op- Amp Parameters – Frequency Response and Compensation – Slew Rate – BIFET and BIMOS Circuits – Three Stage Op. Amp – MOS Op. Amp.

UNIT IV Signal and Data Conversion (18 hours)

Signals and Signal Processing - Sample – and Hold Systems – Analog Multiplexer - Analog Demultiplexer – Digital- to- Analog (D/A) Converters – A Ladder type D/A Converter – Multiplying D/A Converter - Analog- to- Digital (A/D) Converters –The Counting, Successive-Approximation, Parallel Comparator, and Dual-Slope A/D converters - Integrator and Differentiator Circuits – Electronic Analog Computation.

UNIT V Microprocessor and Microcontroller (18 hours)

8085 and its Architecture – Introduction to 8085 Instructions – Data Transfer Operations – Arithmetic Operations – Logic Operations – Branch Operations – Writing Assembly Language Program – Debugging a Program – Introduction to Intel 8051 microcontroller – pins of 8051 – Instruction set – Memory organizations of 8051 – Addressing Modes – Classification of Instructions – Data Transfer Instructions – Assembly Language Programs.

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

- **CO1:** Explain the characteristics of Field Effect Transistor (FET) and derive its parameters.
- **CO2:** Express the operation of Flip- Flops and their applications in digital logic circuits.
- **CO3:** Analyse the architecture of operational amplifier and its parameters.
- **CO4:** Identify and explain various signal conversion techniques.
- **CO5:** Describe the architecture of microprocessor and microcontroller, develop some programs for its operation.

ENERGY PHYSICS

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives:

- To get an idea about the necessary non-conventional energy sources to manage the energy crisis.

UNIT 1 An Introduction to Energy Sources (12 hours)

An Introduction – Energy consumption as a measure of prosperity – conventional sources (coal, oil and gas) and energy production – availability and problems associated.

UNIT 2 Radiation Measurements (12 hours)

Solar constant – solar radiation at the earth's surface- solar radiation measurement [Pyrheliometer (Angstrom, Abbot silver disk, Eppley) – Pyranometer].

UNIT 3 Solar Energy Collectors (12 hours)

Introduction – physical principle of the conversion of solar radiation into heat – flat plate collectors (water and air heaters only) - concentrating collectors [Focusing type (parabolic trough reflector, mirror – strip reflector)

UNIT 4 Some Other Applications of Solar Energy (12 hours)

Solar water heating (pressurized natural circulation) - Introduction to solar photo-voltaic – Solar distillation – Solar cooking (design principle and constructional detail of a box type solar cooker).

UNIT 5 Other Forms of Energy (12 hours)

Wind energy (formation, character and production) – Basics principles of - biomass and biogas - hydro power production – thermo electric power generation – nuclear power generation.

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

CO1: Describe the energy consumption of the world in day today life.

CO2: Illustrate the methods of solar radiation measurements.

CO3: Explain the working of solar energy collectors.

CO4: Discuss the use of solar energy in real life applications.

CO5: Analyse the production of energy through other non-conventional energy sources

PRACTICAL – I (General Physics)

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives:

- To perform experiments in order to calculate physical properties such as magnetic, electric, optical and also to find the physical constants such as Cauchy's, Hartmann's, Stephen's and elastic constants.

Any 14 of the following practical

1. Determination of Cauchy's constant using Spectrometer
2. Measuring conductivity of Germanium (Ge) Crystal by applying Four Probe Method
3. Calculate the velocity and compressibility of ultrasonic waves in liquids by employing Ultrasonic Interferometer
4. Determination of unknown wavelengths using comparator
5. Determination of Planck's constant (h) by using photo cell/LED's
6. Measurement of magnetic susceptibility (**χ**) by using Quincke's method
7. Determination of elastic constants in hyperbolic fringes
8. Determination of bandwidth and wavelength of light using bi-prism – optic Bench
9. Determination Energy Gap of semiconducting material like Germanium(Ge)
10. Determination of thickness of thin mica sheet, resolution of D1, D2 lines of Sodium using Michelson Interferometer
11. Determination of Elastic constants by forming elliptic fringes
12. Study the Hall effect in semiconductors
13. Determine the wavelength of prominent lines in the band spectrum by applying Hartmann's formula
14. Determination of Stefan's constant
15. Determination of numerical aperture and bending loss using LASER
16. Détermination of wave length of prominent lines of Arc spectra of metals like Al, Cu and Fe using Constant deviation spectrograph.
17. Determine the specific charge of an electron (e/m) by Magnetron method
18. Determine the dielectric constant of a given liquid using wavemeter
19. Experiments using Solar photo-voltaic system

2. Department of Physics, St.Joseph's College (Autonomous), Advanced Physics Experiments For M.Sc., Physics Programme, 2005

Teaching Learning Methods:

Lecture Method, ICT, Demonstration, Hands-on session

Course Outcomes

On completion of the course, the students will be able to

CO1: Find the magnetic properties of the liquid by Quincke's method.

CO2: Perform optical experiments to determine the wave length of source, Cauchy's constant, Hartmann's constant and elastic constant
CO3: Carryout the experiments to calculate physical properties of known materials.
CO4: Measure the electrical properties like energy gap, conductivity, carrier concentration
CO5: Determine the physical constants by performing advanced experiments.

PRACTICAL – II (ELECTRONICS)

(For Students admitted from the Academic Year 2022-2023 onwards)

Course Objectives:

- To facilitate the learners in designing and constructing electronic circuits and study their performance.

Course Outline:

Any 14 of the following practical

1. Study the FET Characteristics
2. Design an amplifier circuit using FET
3. Construct a two stage RC- coupled transistor amplifier without feed back and study its frequency response
4. Construct the basic circuit of differentiator, integrator, adder, subtractor using OP-AMP
5. Design and study an Astable Multivibrator using IC 555 Timer.
6. Construction of filter circuits using OP-AMP
7. Study the characteristics ofSCR and discuss its applications
8. Construct a Wien's bridge oscillator using OP-AMP
9. Design a Dual Power supply using IC's
10. Study the characteristics and basic parameters ofOP-AMP
11. Demonstrate the characteristics and applications ofUJT
12. Construct a two stage RC- coupled transistor amplifier with feedback and study its frequency response
13. Construct a regulated power supply using IC's
14. Design and construct a Schmidt trigger using IC 555
15. Design a D/A converter (4 – bit binary weighted register)
16. Construct a wave generatorusing OP-AMP
17. Solvesimultaneous equations anddifferential equationsusing OP-AMP
18. Design and circuit constructionof PCB

References:

Teaching Learning Methods:

Lecture Method, ICT, Demonstration, Hands-on session

Course Outcomes:

On completion of the course, the students will be able to

CO1: Study the characteristics of FET, UJT and SCR and their applications

CO2: Design circuits using OP-AMP and determine their parameters.

CO3: Construct two stage amplifier using transistors and study the parameters.

CO4: Construct electronic circuits using ICs and study their performance

CO5: Design a PCB for an electronic circuit

3.	Nanophysics	3.	Microprocessor
4.	Applied Optics & Laser Physics	4.	Medical Physics

ARUL ANANDAR COLLEGE (AUTONOMOUS), KARUMATHUR
DEPARTMENT OF PHYSICS
Programme Specific outcomes (PSOs)

On completion of the programme, the graduates will have

PSO1: A better understanding of the concepts and diverse fields in Physics.

PSO2: Outstanding proficiencies in applying various concepts in physics to fulfil the regional, national and global needs.

PSO3: The skill to communicate effectively and demonstrate experiments and the ability to analyse & interpret the concepts of physics that will enable them to shine in the field of education, research and development.

PSO4: The capability to socialise with our society, perform collaborative inter-disciplinary activities, take part in internship/ on-site training and to undertake research projects.

PSO5: The intention to work in the field of physics and the desire to make it as a lifelong learning process for their continued academic and professional development.

Arul Anandar College (Autonomous), Karumathur

QUANTUM MECHANICS – II

(For Students admitted from the Academic Year 2020-2021 onwards)

Course Objectives

- To get an idea about the variational principle and various Perturbation theories to quantum mechanical systems
- To understand the structure and properties of molecules and effects of symmetry andasymmetry wave functions.
- To study the scattering theory for various scattering phenomena.
- To apply Klein Gordon and Dirac equations to study the relativistic particles.
- To compare the classical and quantum field equations

UNIT 1 Variation Method & Perturbation Theory (18 hours)

The Variational Principle-Rayleigh-Ritz Method-variation method of excited states-the Hellmann-Feynman Theorem-Ground state of Helium-Ground state of Deuteron-Time-dependent perturbation theory – I order perturbation – Harmonic perturbation – Transition to continum states- Fermi's Golden Rule-Absorption and Emission of Radiation-Electromagnetic Field-Electric dipole Approximation –Transion probability-Einstein's A and B coefficients-Forbidden transitions.

UNIT 2 Many Electron atoms (18 hours)

Indistinguishable particles – Pauli principle – inclusion of Spin- Spin functions for two and three electrons – Helium atom – Thomas-Fermi model of the atom – Hartree Equation – Hartree-Fock Equation.

UNIT 3 Scattering (18 hours)

Scattering cross section- scattering amplitude – partial waves –partial waves analysis – significant number of partial waves – scattering by an attractive square –well potential – Breit-Wigner formula – scattering length – expression for phase shifts – Integral equation – The Born approximation – scattering by screened coulomb potential – validity of Born approximation.

UNIT 4 Relativistic Wave Equations (18 hours)

Klein Gordon equation–Interpretation– Particle in a Coulomb field – Dirac's equation for free particle- Dirac's Matrixes- Probability Density-Plane Wave equation – Negative energy state- Spin of the Dirac particle- Magnetic moment of the electron- Spin orbit interaction - Radial Equation for an electron in a central potential -Hydrogen atom- Lamb shift

UNIT 5 Quantum Field Equation (18 hours)

Classical Field equation- Lagrangian Form- Hamiltonian Form- Quantisation of the Field – Schrödinger equation – Classical theory of Electromagnetic field -Quantisation of Electromagnetic field.

Book for study

1. G. Aruldhas, Quantum Mechanics 2nd ed., Prentice Hall India Learning Pvt. Ltd (2008). Unit I- Chapter 10&12

Unit II- Chapter 13
Unit III- Chapter 14
Unit IV- Chapter 15
Unit V- Chapter 16

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, students should be able to

CO1: Apply the variational principle and various Perturbation theories to quantum mechanical systems

CO2: Understand the structure, properties of molecules, and effects of symmetry and asymmetry wave functions.

CO3: Develop the required solutions for various scattering phenomena.

CO4: Apply Klein Gordon and Dirac equations to study the relativistic particles.

CO5: Compare the classical and quantum field equations

SOLID STATE PHYSICS – I

(For Students admitted from the Academic Year 2020-2021 onwards)

Course Objectives

- To understand the concepts of crystals and lattices.
- To discuss the theory of defects and dislocations.
- To acquire knowledge of phonons and their thermal properties
- To explain the concepts of free electron in crystals and band theory
- To clarify the electronic conduction in solids using various methods.

UNIT 1 Crystal Physics 18 Hours

Periodic arrangement of atoms – concepts of a lattice – lattice translation vectors – primitive lattice cell – two-and three dimensional lattice types – Miller indices of crystal planes – Simple crystal structures like sodium chloride type – cesium chloride type – hexagonal and face centered close packed structures – diamond structure and cubic zinc sulphide structure. Diffraction of waves by crystals :Bragg's law – Reciprocal lattice vectors – Laue equations – Brillouin zones – Reciprocal lattices to sc, bcc and fcc lattices – Fourier analysis of the basis and structure factors of bcc and fcc lattices.

UNIT 2 Defects and Dislocations 18 Hours

Lattice vacancies – Diffusion – Metals – Colorcenters – F centers – Other centers in alkali halides – Frenkel defects – Schottky defects. Shear strength of single crystals – Slip – Dislocation – Burgers vectors – Stress fields of dislocations – Strength of alloys – Dislocations and crystal growth – Whiskers.

UNIT 3 Phonons 18 Hours

Vibrations of linear monoatomic and diatomic chains – quantization of elastic waves – phonon momentum – Plank distribution for a system of identical harmonic oscillators – Periodic boundary condition and density of states in one and two dimensions – Einstein and Debye's theories of specific heat – Anharmonicity of lattice vibrations – thermal expansion – Thermal conductivity and umklapp processes.

UNIT 4 Free Electron in Crystals and Band Theory 18 Hours

Energy levels in one dimensions – Fermi-Dirac distribution for a free electron gas – periodic boundary condition and free electron gas in three dimensions – Heat capacity of the electron gas – Ohm's law – Matthiessen's rule and Umklapp process – Hall effect – Wiedemann – Franz law – Nearly free electron model and the origin and magnitude of the energy gap – Bloch functions – Motion of an electron in a periodic potential – Kronig-Penny model – Bloch theorem – Approximate solution near a zone boundary

UNIT 5 Electronic Conduction in Solids 18 Hours

Semiconductor crystals, fermi surfaces and metals Band gap in semiconductors – Equations of motion – holes and effective mass – Intrinsic mobility – Donor and acceptor states and thermal ionization of donors and acceptor – Reduced and periodic zone schemes – Construction of Fermi surfaces – Electron orbits – Tight-Binding method for energy bands – Wigner-Seitz method and cohesive energy – Quantization of orbits in a magnetic field – De Hass-Van Alphen effect.

MOLECULAR SPECTROSCOPY

(For Students admitted from the Academic Year 2020-2021 onwards)

Course Objectives:

- To understand the concept of rotational spectra of the molecule.
- To get an insight into the vibrational spectroscopy.
- To describe the Raman effect and its applications.
- To analyse the intensity of vibrational electronic spectra.
- To distinguish the NMR and ESR spectroscopy.

UNIT –I Microwave Spectroscopy 18 Hours

Classification of molecules – Interaction of Radiation with rotating molecule – Rotational Spectra of rigid diatomic molecule – Isotopic effect in rotational spectra – Intensity of rotational lines – Non-rigid rotator – vibrational excitation effect – linear polyatomic molecule – symmetric top molecule – Asymmectric top molecules – Microwave spectrometer – Information derived from rotational spectra.

UNIT – II Infrared Spectroscopy 18 Hours

Vibrational energy of a diatomic molecule – Infrared Spectra – preliminaries – Infrared selection rule – vibrating diatomic molecule – diatomic vibrating rotator – Asymmetry of rotation – Vibration band – vibrations of polyatomic molecules – more about anharmonicity – fermi resonance –IR spectrophotometer – Instrumentation – Sample handling techniques – Fourier transform infrared spectroscopy – Applications: Identification of molecular constituents - characterisation of the transistion phase of ceramics

UNIT – III Raman Spectroscopy 18 Hours

Introduction – Theory of Raman scattering – Rotation Raman spectra – Vibrational Raman spectra – Mutual Exclusion principle – Raman spectrometer – Sample handling techniques – Polarization of Raman scattered light –Structure determination using IR and Raman spectroscopy.

Nonlinear Raman phenomena – Preliminaries – Hyper Raman Effect – Simulated Raman scattering – Inverse Raman effect.

UNIT – IV Electronic Spectroscopy 18 Hours

Introduction – Vibrational coarsestructure – Vibrational analysis of band systems – Deslandres Table – Progressions and sequences – Information derived from vibrational analysis – Franck-Condon principle – Intensity of vibrational electronic spectra – Rotational fine structure of electronic-vibration spectra – The FortratParabolae – Dissociation – Predissociation.

UNIT – V Resonance Spectroscopy 18 Hours

Nuclear Magnetic resonance – NMR instrumentation – Relaxation process – Bloch equation – Dipolar interaction – Chemical shift – Indirect spin-spin interaction – NMR imaging – Electron spin resonance – Principle – ESR spectrometer – Mossbauer Spectroscopy – Recoilless emission and absorption – Experimental techniques – Isomer shift.

NANOPHYSICS

(For Students admitted from the Academic Year 2020-2021 onwards)

Course Objectives:

- To enrich the students with the foundational knowledge of size dependant properties of Nanostructures.
- To develop the skill of constructing simple models of nanostructures and to compare the properties of nanoclusters
- To instil the students enumerating various methods of synthesis of nanoparticles.
- To help the students to associate the low-dimensionality effects with the change in properties.
- To equip the students to express the working of molecular switches.

Course Outline:

UNIT 1: Introduction to Physics of the Solid State and Methods of Measuring Properties (18 hrs)

Size dependence of properties – Crystal structures – FCC nanoparticles – Tetrahedrally Bonded semiconductor structures – Lattice vibrations –Crystallography – Particle size determination – Surface structure – Transmission Electron Microscopy – Field Ion Microscopy – Scanning Microscopy – IR and Raman spectroscopy – Photoemission and X-ray spectroscopy – Magnetic resonance.

UNIT 2: Properties of Individual Nanoparticles (18 hrs)

Metal nanoclusters: Magic numbers – Theoretical modelling of nanoparticles – geometric structure – Electronic Structure – Reactivity – Fluctuations – Magnetic clusters – Semiconducting nanoparticles: optical properties – Photofragmentation – Coulombic explosion – Rare gas and molecular clusters: Inert gas clusters – superfluid clusters – molecular clusters – Methods of synthesis: RF Plasma – Chemical methods – Thermolysis – Pulsed Laser Methods

UNIT 3: Carbon Nanoclusters (18 hrs)

Carbon molecules: nature of the carbon bond – New carbon structures – Carbon clusters: Small carbon clusters – Structure of C_{60} and its crystal – Alkali Doped C_{60} – Superconductivity in C_{60} – Carbon nanotubes: Fabrication – Structure – Electrical properties – Vibrational properties – Mechanical properties – Applications of carbon nanotubes: Field emission and shielding – computers – fuel cells – mechanical reinforcement.

UNIT 4: Quantum Wells, Wires and Dots: (18 hrs)

Preparation of quantum nanostructures – Size and dimensionality effects: (Size effects – conduction electrons and dimensionality) – Fermi gas and density of states – potenial wells – partial confinement – properties dependent on density of states – Excitons – Single-electron tunnelling – Applications: IR detectors – quantum dot lasers.

UNIT 5: Nanomachines and Nanodevices: (18 hrs)

Microelectromechanical systems (MEMSs) – Nanoelectromechanical Systems (NEMSs): Fabrication – Nanodevices and nanomachines – Molecular and supramolecular switches (Any three switches).

4. Cuozhong Cao, University of Washington, USA, Nanostructures &Nanomaterials, 2004, Imperial College Press.

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course Outcomes:

CO1: Gain the foundational knowledge of size dependant properties of Nanostructures and various microscopic and spectroscopic techniques.
Construct a model for Cuboctahedron

CO2: Elucidate and compare the properties of nanoclusters and enumerate various methods of synthesis of nanoparticles.

CO3: Describe Carbon nanoclusters and various properties of carbon nanotubes.

CO4: Associate the low-dimensionality effects with the change in properties.

CO5: Compare MEMSs and NEMSs and analyse the working of molecular switches.

Mapping of COs with POs and PSOs

SEMESTER III	**Subject Code: 20PPYE33**								**Title of Paper: NANOPHYSICS**					**Sum of COs with PSOs and POs**
Course Outcomes (CO'S)	**Programme Outcomes (PO'S)**								**Programme Specific Outcomes (PSO'S)**

MICROPROCESSORS

(For Students admitted from the Academic Year 2020-2021 onwards)

Objective : To understand the concepts of microprocessors, programming and interfacing.

Course Objectives:

- To write assembly language program using different operations/instructions.
- To classify the data transfer, arithmetic and logical operations.
- To describe the counters and time delay concepts.
- To explain the 8085 interrupts and converters.
- To distinguish the configurations and instructions of 8086 and 8088 microprocessors.

UNIT 1 8085 Instructions and Operations: (18 hrs)

8085 and its architecture – Instruction classification – Instruction format –assemble and execute a simple program – Introduction to 8085 instructions – Data transfer operations – arithmetic operations – logic operations – branch operations – writing assembly language program – debugging a program.

UNIT 2 Programming Techniques with Additional (18 hrs)

INSTRUCTIONS: Programming techniques: Looping – Counting and indexing – additional data transfer and 16-bit arithmetic instructions – arithmetic operations related to memory – Logic operations – Rotate and compare – dynamic debugging.

UNIT 3 Counters and Time Delays: (18 hrs)

Counters and time delay illustrative programs – hexadecimal counters – zero to nine counter – generating pulse waveform-debugging counters and time delay programs – Stack – subroutine – conditional call and return instructions – advanced subroutine concepts.

UNIT 4 Interrupts: (18 hrs)

The 8085 interrupts – 8085 vectored interrupts – restart as software instructions. INTERFACING DATA CONVERTERS: – 8255A programmable peripheral interface - Digital to analog converters – Analog to digital converters.

UNIT 5: Other Microprocessors: (18 hrs)

Intel 8086 – Pin description – Operating modes – Operation – registers – interrupts – lock – bus cycle – typical configuration – instructions – addressing modes – Intel 8088 – pin configuration – typical 8088 based computer system.

Teaching Learning Methods:

- Lecture Method, ICT, Demonstration, Assignment, Quiz, Group Discussion

Course Outcomes

On completion of the course, the students will be able to

CO 1: Write the assembly language program using different operations/instructions.

CO 2: Classify the data transfer, arithmetic and logical operations.

CO 3: Analyse the counters and time delay concepts.

CO 4: Understand the 8085 interrupts and converters.

CO 5: Explain the configurations and instructions of 8086 and 8088 microprocessors.

Code	**: 20PPYP34**	**Credit**	**: 4**

PRACTICAL – III

(For Students admitted from the Academic Year 2020-2021 onwards)

Course Objectives

- To construct and apply the physics principles of registers and counters using flip flops
- To equip the principles of digital electronics and construct a decimal to BCD encoder and decoder
- To analyse the functions of Arithmetic and logic operations.
- To study the various operations and interfacing using microprocessor
- To use the microcontroller programming for various applications.

Any 12 of the following list of experiments:

1. R-S,J-K and D-flip flops
2. Shift registers
3. Different mod counters
4. Asynchronous counters
5. Encoder / Decoder
6. Multiplexer and Demultiplexer
7. Arithmetic and logic unit
8. Karnaugh Map
9. Microprocessor – I (1 bit and 2 bit numbers shift by left and right, largest and smallest, block data transfer)
10. Microprocessor – II (1's and 2's complement subtraction, sum of series binary and decimal)
11. Microprocessor – III (seven segment display and interfacing with seven segment display).
12. Microprocessor – IV (interfacing with traffic controller and stepper motor)
13. Microprocessor – V (interfacing with DAC)
14. Microcontroller – Stepper motor
15. Microcontroller – AD & DA Converter
16. Microcontroller – LED Lamp
17. Microcontroller – Matrix Keyboard
18. Microcontroller – Seven Segment
19. Microcontroller – LED Lamp
20. Microcontroller – LCD & RTC

Teaching Learning Methods:

- Lecture Method, Demonstration, Hands-on session

Course Outcomes

On completion of the course, the students will be able to

CO 1: Construct the registers and counters using flip flops

CO 2: Construct a decimal to BCD encoder and decoder

CO 3: Analyse the Arithmetic and logic units.

CO 4: Study the various operations and interfacing using microprocessor

CO 5: Use the microcontroller programming for various applications.

Mapping of COs with PSOs & POs:

SOLID STATE PHYSICS – II

(For Students admitted from the Academic Year 2020-2021 onwards)

Course Objectives

- To understand the physical importance of excitation and optical processes in solids.
- To define the concepts of super conductivity by different theories.
- To compare the different types of magnetism and their effects in solids.
- To study the concepts of dielectrics and its related theories.
- To investigate the phenomenon of surface and interface physics.

UNIT I Excitation and Optical Processes in Solids (18 hours)

Dielectric function of the electron gas – longitudinal plasma oscillation – plasmons – Electrostatic screening – Screened coulomb potential – Mott transition – Screening and phonons in metals – Polaritons and LST relation – Electron – Electron interaction – phonon interaction and polarons – Peierls instability – Kramers – Kronig dispersion relations – Frenkel and Mott – Wannier excitons – Exciton condensation – Raman effect in crystals.

UNIT II Super Conductivity (18 hours)

Its occurrence and its destruction by magnetic fields – Miessner effect – Heat capacity – Energy gap – microwave and infrared properties and isotope effect – Stabilization energy of a superconductor – London theory of Meissner effect – coherence length – Basic ideas of BCS – flux quantization – Type II superconductors and vortex state – Single particle tunnelling DC and AC Josephson effects – Macroscopic quantum interference – High temperature super conducting (HTC) materials.

UNIT III Magnetism in Solids (18 hours)

Langevin diamagnetism equation and quantum theory of dia-magnetism – Quantum theory of para magnetism – Hund's rules – Crystal field splitting and quenching of orbital angular momentum – Spectroscopic splitting factor – Van vleck temperature independent paramagnetism – Ferro magnetism : Curie point – Weiss molecular field theory – Saturation magnetization – Quantization of spin waves (magnons) and thermal excitation of magnons – Ferromagnetism and antiferromagnetism – Neel temperature – Ferromagnetic domain walls and origin of domains – Coercivity and hysteresis.

UNIT IV Dielectrics (18 hours)

Maxwell equations- Polarization- Macroscopic electric field- Depolarization field-Local electric field at an atom- Lorentz field-Field of dipoles in cavity-Dielectric constant and polarizability- Electronic plolarizability- classical theory of electronic plolarizability- Structure phase transitions

UNIT V Surface and Interface Physics (18 hours)

IQHE and FQHE – PN junction – Rectification – Solar cells – Photovoltaic detectors. Substitutional solid solutions – Hume Rothery rules – Elementary theory of order – Kondo effect. Ferro electric crystals – Classification – Displacive transition – Soft optical phonon – Landau theory of phase transition – first order and second order transition.

NUCLEAR AND PARTICLE PHYSICS

(For Students admitted from the Academic Year 2020-2021 onwards)

Course Objectives:

1. Understand the properties of nucleus and the concept of nuclear forces.
2. Compare the types of nuclear decays and radioactivity.
3. Analyse the different types of nuclear models.
4. Explain the various nuclear reactions like fission and fusion.
5. Identify the symmetry properties & study the quark model of elementary particles.

UNIT I Nuclear Properties and Nuclear Forces (18 hours)

Charge – mass – radius – angular momentum (spin) – Magnetic dipole moment – Electric quadrapole moment – Parity – Isobaric spin (isospin) – The nuclear level – Nuclear forces : Introduction – Deuteron (properties of Nuclear force, no excited S-states, range and depth of potential – Excited states of the Deuteron) – Neutron – Proton scattering at low energies (Scattering length, Phase shift, Spin-dependence) – Proton – Proton scattering at low energies – Similarity between nn and pp forces – Non-central forces (Experimental evidence for the non-central forces, General form of this force, its properties - Meson theory of nuclear forces.

UNIT II Radio Activity (18 hours)

Laws of radioactivity – radioactive equilibrium – radioactive series – isotopes - α-decay - α-particle spectra – Gamow's theory of α-decay –β-decay - β-spectroscopy (no instrumentation) – neutrino –direct method – Fermi theory – Gamma radiation – measurement of γ-ray energies (wavelength measurement by crystal diffraction)– Internal conversion (idea only) - Internal pair creation – nuclear isomerism.

UNIT III Nuclear Models (18 hours)

Introduction – Fermi gas model – Liquid drop model – Shell model (Magic numbers , Extreme single particle model, (Square well of infinite depth, Harmonic Oscillator Potential, Spin-Orbit Potential), Predictions of Shell Model- Basic Concepts of Collective Nuclear Model, Unified Model, Superconductivity model.

UNIT IV Nuclear Reactions, Fission And Fusion (18 hours)

Kinds of Nuclear reactions – Conservation Laws – Nuclear reaction kinematics –– Nuclear cross section – Compound nucleus – Nuclear transmutations – By alpha particles - by protons – by neutrons – by deuterons -Direct reactions (Stripping reactions, Pickup reactions), Stripping reactions and the shell model.Nuclear Fission (Types of Fission, Distribution of fission products, Neutron Emission in Fission, Fissile and Fertile materials, Spontaneous fission, Deformation of liquid drop, Bohr and Wheeler's Theory – Quantum effects) - Nuclear Fusion and Thermo nuclear reactions – Controlled thermonuclear reactions (hydrogen bomb, Different methods for the production of fusion reactions)

UNIT V Sub-Nuclear Physics (18 hours)

Inroduction – Classifiation of Elementary particles – Fundamental interactions – Conservation laws – Conservation of isospin, strangeness, hypercharge, conjugation, parity, combined inversion, time reversal, CPT – Elementary particle symmetry – SU(2) group – SU(3) group – Quark.

APPLIED OPTICS AND LASER PHYSICS

(For Students admitted from the Academic Year 2020-2021 onwards)

Course Objectives

- To understand the basic principles of Laser and its mechanisms.
- To explain the basic phenomenon of Q-switching and mode locking laser systems.
- To discuss different laser systems and Fourier transform properties of lens systems.
- To describe the electro optic effects and their applications in various crystals.
- To acquire the knowledge of non-linear optics and fundamentals of optical fibre systems.

UNIT I Laser- I **(18 hours)**

Einstein coefficients – Light amplification – threshold condition – Laser rate equations – variation of Laser power around threshold- Optimum output coupling – Line broadening mechanisms

UNIT II Laser-II **(18 hours)**

Modes of a rectangular cavity and the open planar resonator- Quality factor – The ultimate line width of the Laser – Mode Selection – Q- Switching – Mode locking in Lasers – General spherical resonator – High order modes

UNIT III Laser Systems & Spatial frequency filtering **(18 hours)**

Laser System- Ruby Laser - Neodymium based Lasers – He-Ne Laser – Argon ion Laser – CO_2 Laser – Dye Laser – Excimer Lasers

Spatial frequency filtering: Introduction - Fourier Transform and some of its important properties – F.T property of a thin lens – some elementary examples of the Fourier transforming property of a lens

UNIT IV Electro-Optic Effect **(18 hours)**

Electro-optic effect in KDP crystals: longitudinal mode & transverse mode – electro-optic effect in lithium niobate and lithium tantalate crystals- general considerations on modulator design- The index ellipsoid in the presence of an external electric field.

UNIT V Optical Fiber& Non- Linear Optics **(18 hours)**

Optical fiber – Numerical aperture (NA) – Pulse dispersion in step index fibers. **Non-linear optics**: Introduction – Self Focusing phenomenon- Second Harmonic Generation-Calculation of nonlinear polarization - Effect of deviation from the phase matching angle-Coupled equation and their solution - Generation of sum and difference frequencies.

MEDICAL PHYSICS

(For Students admitted from the Academic Year 2020-2021 onwards)

Course Objectives:

- To acquire the knowledge of radiation and its effects.
- To understand the interaction of gamma rays and x-rays with matter.
- To study the protocols used in radiation therapy.
- To discuss the radiological imaging techniques.
- To classify the different scanning techniques.

UNIT –I: Radiation, Radiation Dosimetry and Definitions 18 hrs

Radiation – classification of radiation - definitions of Dosimetry Quantities (DQ) - Units and relationship between DQ – relative biological effectiveness – radiation weighting factor, equivalent dose and sievert - linear energy transfer - tissue weighting factor - charged particle equilibrium - biological effects of radiation.

UNIT – II: Interaction of gamma rays and X-rays with matter 18 hrs

Introduction - Types of interaction with matter – Photo electric absorption – Compton scattering – Pair production - Over all interaction of photons with matter – Linear attenuation co-efficient – Half-value thickness – Mean free path

UNIT –III: Treatment planning in radiation therapy 18 hrs

Photon beam treatment planning – Therapeutic response - Radiation Therapy Process - Patient Positioning and Immobilization – Pre-treatment Simulation – Conventional Simulator – Computed Tomography Simulator – Positron Emission Tomography - Electron beam treatment planning - Dosimetric Data for Clinical Electron Beams. – Depth dose profiles – Variation with beam energy – Variation with field size – off-axis dose profile – Electron beam energy specification – Isodose curves

UNIT –IV: Introduction to Radiological Images 18 hrs

X-ray Generator – Attenuation – Major Types of Interactions – Half-value layer and tenth-value layer – Collimator – Anti-scatter grids – screens – Photo -stimulable phosphor (PSP) – image quality measures – signal-to-noise ratio (SNR)

UNIT –V: Magnetic Resonance Imaging (MRI) and Computerized Tomography (CT) 18 hrs

MRI –contrasts in MRI –Physiological and functional MRI –MRI safety –future MRI applications. CT and MRI Radiotherapy: CT based treatment simulation and planning –MRI in Radiotherapy

Course Book

Introduction to Medical Physics – Muhammad Maqbool –Springer International Publishing (2017).

Unit – I:	Chapter - 1:	Sections: 1.1
	Chapter - 2:	Sections: 2.1, 2.2, 2.3, 2.4, 2.5, 2.6, 2.7, 2.8, 2.11, 2.14.
Unit – II:	Chapter - 3:	Sections: 3.1, 3.2.1, 3.2.2, 3.2.3, 3.3, 3.3.1, 3.3.2, 3.3.3.

Unit – III: Chapter - 4: Sections: 4.1, 4.1.2, 4.1.3, 4.1.5, 4.1.6, 4.1.6.1, 4.1.6.2, 4.1.6.4, 4.2, 4.2.2, 4.2.2.1, 4.2.2.2, 4.2.2.3, 4.2.2.4, 4.2.2.5, 4.2.2.6.

Unit – IV: Chapter - 6: Sections: 6.1, 6.2, 6.3, 6.3.1, 6.3.2, 6.4, 6.5, 6.6, 6.7, 6.8, 6.8.1.

Unit – V: Chapter - 9: Sections: 9.1, 9.3, 9.4, 9.5

Chapter - 10: Sections: 10.1, 10.2, 10.3.

Books for Reference:

1. R. S. Khandpur,1999, Handbook of Biomedical Instrumentation - Tata McGraw-Hill, New Delhi.
2. Glenn. F. Knoll, 2010, Radiation Detection and Measurements - John Wiley & Sons, Inc. New York.

Teaching Learning Methods:

- Lecture Method, ICT, Assignment, Quiz, Group Discussion

Course Outcomes:

On completion of the course, the students will be able to

CO1: Acquire the knowledge of quantities used to define radiation and its effects.

CO2: Analysethe characteristics of interaction of gamma rays and x-rays with matter.

CO3: Construe the protocols used in radiation therapy.

CO4: Interpret the radiological imaging techniques.

CO5: Describe the different scanning techniques like MRI and CT.

Mapping of COs with PSOs & POs:

PROJECT WORK

(For Students admitted from the Academic Year 2020-2021 onwards)

Course Objectives:

- To acquire the basic knowledge in the respective field of research.
- To grasp the ideas and results of previous work in literature by reading the research articles.
- To identify a suitable theoretical or experimental model in the field of interest.
- To analyze and interpret the observations for getting suitable solution to the research problem.
- To conclude the results and prepare the dissertation .

Each candidate has to submit a dissertation on any topic in physics after collecting materials and working out the details during the IV semester. It may be a theoretical work or an experimental work or even a compilation of material of current interest from literature.

The dissertation is evaluated by internal and external examiners with viva on the project work

Course Outcomes

On completion of the course, students should be able to

CO1: Acquire the knowledge in the respective field of research.

CO2: Collect the related literature from the available online and offline sources.

CO3: Design a theoretical or experimental model in their field of interest.

CO4: Analyse the observations for getting suitable solution to the research problem.

CO5: Write a dissertation in the approved format in view of writing research articles.

Mapping of COs with PSOs & POs:

ARUL ANANDAR COLLEGE (AUTONOMOUS), KARUMATHUR
DEPARTMENT OF PHYSICS - M.Sc. (PHYSICS) SYLLABUS
(2020 – 21 ONWARDS)

QUESTIONS PAPER PATTERN (External exam)

Section A:		
Answer all the questions (MCQ) (Each unit carry 2 questions)		10 x 1=10
Section B:		
Either or Choice – Short answer question **(2/3 problems may be asked)** (One question from each unit)	(5)	5 x 6 =30
Section C:		
Either or Choice – Long answer question (One question from each unit)	(5)	5 x 12 =60
		Total = 100

ARUL ANANDAR COLLEGE (AUTONOMOUS), KARUMATHUR
DEPARTMENT OF PHYSICS - M.Sc. (PHYSICS) SYLLABUS
(2020 – 21 ONWARDS)

QUESTIONS PAPER PATTERN (Internal exam)

Section A: Online mode
Answer all the questions (MCQ) 8 x 1=8

Section B:
Either or Choice – Short answer question 2x 6 =12
(One problem may be asked)

Section C:
Either or Choice – Long answer question 2x 10=20

_____

Total = 40

ARUL ANANDAR COLLEGE (AUTONOMOUS), KARUMATHUR
DEPARTMENT OF PHYSICS - M.Sc. (PHYSICS)
SYLLABUS
(2020 – 21 ONWARDS)

MARK ALLOTMENT FOR PROJECT WORK

Internal

Literature survey &Seminar presentations	20
Theory or Experiment	20
Preparation of dissertation	10

External

Viva-voce	50

Total = 100

Arul Anandar College (Autonomous), Karumathur
Department of Physics
PG PHYSICS COURSE

SCHEME OF EVALUATION

1. Continuous Internal Assessment

	Marks
Test-1	40
Test -2	40
Assignment / Seminar	20

	Total = 100
	---

2. Semester Examination 100 Marks
3. Total Marks = 50% C.I.A + 50% Semester Examinations
A candidate must score a minimum of 25 marks out of 50 in the semester examination and an overall aggregate minimum of 50 marks out of 100 for a pass.
